563	Initially, fill aeration vessel C and settling vessel D with synthetic sewage. The height of the vessel D should be so fixed that the volume contained in the aeration vessel C is three litres. Inoculation is made by introducing 3 ml of a secondary effluent of good quality, freshly collected from a treatment plant dealing with a predominantly domestic sewage. The effluent must be kept under aerobic conditions in the period between sampling and application. Then set the aerator G, air-lift E and dosing device B in operation. The synthetic sewage must pass through the aeration vessel C at a rate of one litre per hour; this gives a mean retention time of three hours.		Initially, fill aeration vessel C and settling vessel D with synthetic sewage. The height of the vessel D should be so fixed that the volume contained in the aeration vessel C is three litres. Inoculation is made by introducing 3 ml of a secondary effluent of good quality, freshly collected from a treatment plant dealing with a predominantly domestic sewage. The effluent must be kept under aerobic conditions in the period between sampling and application. Then set the aerator G, air-lift E and dosing device B in operation. The synthetic sewage must pass through the aeration vessel C at a rate of one litre per hour; this gives a mean retention time of three hours.	
Annex VII, 7 paragraph				

	Commission Proposal	EP Mandate	Council Mandate	Draft Agreement
564	<p>The rate of aeration should be so regulated that the contents of vessel C are kept constantly in suspension and the dissolved oxygen content is at least 2 mg/l. Foaming must be prevented by appropriate means. Anti-foaming agents that inhibit the activated sludge or contain surfactants must not be used. The air-lift pump E must be set so that the activated sludge from the settling vessel is continually and regularly recycled to aeration vessel C. Sludge which has accumulated around the top of the aeration vessel C, in the base of the settling vessel D, or in the circulation circuit must be returned to the circulation at least once each day by brushing or some other appropriate means. When the sludge fails to settle, its settleability may be increased by the addition of 2 ml portions of a 5 % solution of ferric chloride, repeated as necessary.</p>		<p>The rate of aeration should be so regulated that the contents of vessel C are kept constantly in suspension and the dissolved oxygen content is at least 2 mg/l. Commission Proposal Table 2

b	=	volume of 'carbate solution' used by the sample (ml),
c	=	volume of 'carbate solution' used by the blank (ml),
f	=	factor of the 'carbate solution'.

Council Mandate Table 2

b	=	volume of 'carbate solution' used by the sample (ml),
c	=	volume of 'carbate solution' used by the blank (ml),
f	=	factor of the 'carbate solution'.

Commission Proposal Table 3

A	Storage vessel
B	Dosing device
C	Aeration chamber (three litres capacity)
D	Settling vessel
E	Air-lift pump
F	Collector
G	Sintered aerator
H	Air-flow meter
I	Air

Council Mandate Table 3
