REPORT

From:	General Secretariat of the Council
To:	Permanent Representatives Committee (Part 1)
No. prev. doc.:	6815/1/23 REV 1 COR 1
No. Cion doc.:	10327/21 ADD 1- ADD 3
Subject:	Proposal for a REGULATION OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL on the use of renewable and low-carbon fuels in maritime transport and amending Directive 2009/16/EC – Preparation for trilogue

I. CONTEXT AND CONTENT OF THE PROPOSAL

1. On 14 July 2021, the Commission submitted to the European Parliament and to the Council a proposal for a Regulation on the use of renewable and low-carbon fuels in maritime transport ('FuelEU Maritime')¹, as part of the 'fit for 55' package (the 'package').
2. The main aim of the proposal is to increase the demand for and consistent use of renewable and low-carbon fuels in the maritime sector, while ensuring the smooth operation of maritime traffic and avoiding distortions in the internal market. Notably, its main provisions focus on the following aspects:

¹ ST 10327/21, ADD 1, ADD 2 and ADD 3.

- i) the scope, in terms of the size of the ships concerned and the geographical scope;
 - ii) reduction targets for the greenhouse gas intensity of energy used on board by ships;
 - iii) the requirements for on-shore power supply (OPS) or for the use of alternative zero emission technologies by ships in ports;
 - iv) the certification of renewable and low-carbon fuels; and
 - v) the governance relating to these new obligations, including the penalties to be applied to companies in cases of non-compliance of their ships and the assignment of the revenue generated by these penalties to the Innovation Fund.
3. FuelEU Maritime has also links with Regulation (EU) 2015/757 on the monitoring, reporting and verification of carbon dioxide emissions from maritime transport² and other proposals in the package, in particular those on renewable energy (RED), on the deployment of alternative fuels infrastructure (AFIR), and on the emissions trading scheme (EU ETS).

II. STATE OF PLAY

4. The European Economic and Social Committee adopted its opinion on the abovementioned proposal on 8 December 2021, while the European Committee of the Regions declined to deliver an opinion.
5. The Council agreed on a general approach on 2 June 2022.
6. The European Parliament designated the Committee on Transport and Tourism (TRAN) as the committee responsible for the FuelEU Maritime proposal and Mr Jörgen Warborn (SE, EPP) was appointed as its rapporteur. The European Parliament adopted its position in plenary on 19 October 2022.
7. The co-legislators swiftly engaged in negotiations and, between 27 October 2022 and 16 February 2023, three informal trilogues took place.
8. Such informal trilogues were prepared and facilitated through an intensive work carried out at the technical level and twelve technical meetings were organised accordingly.

² OJ L 123, 19.5.2015.

9. Between 7 November and 14 March 2023, the Shipping Working Party examined all European Parliament amendments, as well as Presidency's compromises or drafting suggestions as regards the whole text of the proposal.
10. At a third informal trilogue held on 16 February 2023, the co-legislators addressed all elements of the proposal and confirmed the work done at the technical level as regards a number of provisions on which convergence could be found – the so-called “green lines”. As regards the outstanding issues, the discussion focused on six aspects; namely:
- a) the certification of fuels – Article 9;
 - b) the requirements for on-shore power supply -OPS- and for zero-emission technologies – Article 5 and newly introduced Annex III;
 - c) the “exceptions” for specific treatment of small islands and of areas economically highly dependent on their connectivity, the so-called PSO routes – Article 2, as well as the reduction factors for ice-classed ships and ships navigating in ice – Article 4 and Annex Va of the European Parliament text and Annexes I and IV of the Council general approach;
 - d) the GHG reduction targets and the use of the renewable fuels of non-biological origin (“RFNBO”) – Articles 4, 4a (as proposed by the European Parliament) and Annex I;
 - e) the report and review clause – Articles 28 and 28a as proposed by the European Parliament; and
 - f) the provisions on revenues generated from remedial penalties and their allocation – Articles 20 and 21.
11. On the three aspects of the certification of fuels, OPS and zero-emission technologies as well as the report and review clause, the exchange was overall constructive and in line with technical work.

12. As regards the exceptions, the reduction factors for ice-classed ships, the GHG reduction targets and RFNBO as well as the revenues generated from remedial penalties and their allocation, the discussion did not lead to significantly reduce the gap.
13. Therefore, no overall political agreement was reached.

III. THE PROPOSED MANDATE

14. After the third informal trilogue, work extensively continued at the technical level.
15. To date, several aspects appear to be provisionally agreed (marked in green in the annexed four-column document); *inter alia*, the following ones:
- the objective and purpose (Article 1- lines 54-60)
 - the scope, in terms of the size of the ships concerned and the geographical scope (Article 2 – lines 61 to 64, 65, 66);
 - some definitions (Article 3 – lines 75 to 78, 79, 80, 84, 85, 86 to 89, 91, 92, 93 and 99);
 - technical provisions related to additional zero-emission requirements of energy used at berth (Article 5 – lines 113, 115 to 119, 122 to 124, 126);
 - provisions to consider and reward wind assisted propulsion ships (including lines 66, 76b, 151bb, 216c 283ee and the part of Annex I on the wind reward factor);
 - governance provisions as regards common principles for monitoring and reporting, the monitoring plan, its modifications and its assessment, obligations for the verifiers, verification procedures, accreditation of the verifiers as well as monitoring and recording activities (Articles 6 to 8 and 10 to 14 – lines 129 to 145, 147 to 151, 151bb, 152 to 160, 161, 161b, 162, 171 to 173b, 174, 175, 176 to 182a, 183 to 192, 193 to 194e, 195 to 195b, 197 to 200, 201, 202, 202a, 204, 205 and 206a to 206c)
 - Article 19 on the FuelEU document of compliance (lines 233 to 242);

- the obligation to carry a valid FuelEU certificate of compliance on-board and provisions relating to enforcement, to the right to review and to competent authorities (Articles 22 to 25 – lines 252 to 266);
 - provisions relating to the calculation of the remedial penalties (Article 20 – lines 244a to 246).
16. Recitals that are not yet “greened” in the annexed four-column document either have not been thoroughly discussed with the European Parliament or will have to be adjusted based on the agreement reached. Therefore, they are without prejudice to further technical discussion and legal revision.
17. Nevertheless, the outstanding issues indicated under point 10, sub-points a) to f) are expected to be the main points of discussion at the fourth informal trilogue. Since all these issues have an impact on the overall balance of the text, it is the view of the Presidency that they cannot be negotiated separately but as part of a package, as follows:
- i. **“exceptions” for the specific treatment of small islands and of areas economically highly dependent on their connectivity, the so-called PSO routes** as well as the **reduction factors for ice-classed ships and ships navigating in ice** were highly debated during the third informal trilogue. Therefore, the technical level worked towards finding further convergence in this respect. In particular: 1) as regards the PSO routes, the compromises reflected in the annexed four-column document address the specific situations of Member States that are highly dependent on their transnational connectivity (lines 15d and 65d) or that need to ensure an appropriate level of connectivity to island regions, at affordable prices (lines 66n); 2) as regards the threshold for the identification of small islands (i.e. “100000” or “200000” permanent residents respectively in the European Parliament text and in the Council general approach), the Presidency suggests maintaining the Council general approach; 3) when it comes to the reduction factors for ice-classed ships and ships navigating in ice, the Presidency maintains the compromise submitted to Coreper for preparations before the third informal trilogue (ST 6060/23+COR);

- ii. **the reduction targets for the greenhouse gas intensity of energy used on board by ships and the use of the so-called renewable fuels of non biological origin - RFNBO- and their mandatory 2% sub-quota.** These aspects are perceived to be of highly political nature by the co-legislators. At the third informal trilogue, the European Parliament was firm in highlighting that no agreement can be reached without both increasing the GHG reduction targets and introducing a sub-quota for RFNBO.

Based on discussions held with the European Parliament as well as with the Member States at the level of the Shipping Working Party and with a view to reduce the gap between the co-legislators, the Presidency asks for guidance on a compromise suggestion (cumulatively) comprising the following elements:

A. an increase of the GHG reduction targets³ as follows:

- ✓ 2% from 1 January 2025;
- ✓ 7% from 1 January 2030;
- ✓ 15% from 1 January 2035;
- ✓ 35% from 1 January 2040;
- ✓ 62% from January 2045;
- ✓ 80% from 1 January 2050.

B. a new approach to the provisions on RFNBO.

Such an approach would consist of the following elements:

- 1) a slight increase of the time-limited multiplier, i.e. a reward factor of 2 from 1 January 2025 to 31 December 2034 (see new Article 4a and Annex I to the Council GA); and

³ As regards the reduction targets for the greenhouse gas intensity of energy used on board by ships, while the Council general approach maintains the Commission proposal, the European Parliament increases the following percentages: from 13% to 20% as of 2035; from 26% to 38% as of 2040; from 59% to 64% as of 2045; and from 75% to 80% as of 2050.

2) the introduction of a RFNBO sub-quota, in the context of a “**sunrise clause**”. In this respect, the Commission should start monitoring the market as of 1 January 2025 (i.e. the starting date set for the possible use of the multiplier) as regards the RFNBO availability in different ports and their geographical distribution. The results of this monitoring should be published on an annual basis. If, by a set date, monitoring shows that the uptake of RFNBO is inferior to 1%, despite their availability, a sub-quota of 2% (i.e. the figure proposed by the European Parliament) is applied from 1 January 2035 (i.e. after the possibility to make use of the multiplier ceases) – “sunrise clause”.

The Commission should continue monitoring the market so that the feasibility of the “sunrise clause” can be addressed (e.g. there are serious concerns about production capacity, availability to the maritime sector, uneven geographical distribution or too high price of RFNBOs;). If the sub-quota kicks in, non-compliance should be subject to a remedial penalty. However, introducing a standing-alone remedial penalty might result in a disproportionate imposition that might not be fair. Therefore,

1) if the sub-quota is not met but the GHG reduction targets are met; or 2) if both the sub-quota and the GHG reduction targets are not met, the remedial penalty should be proportionate (taking into account the main goal of the Regulation, i.e. reducing GHG). This criterion, together with other frame provisions (e.g. basic indications in the formula) should be addressed in the Regulation, while details could be further specified by implementing acts; provisions on verification and calculation (e.g. Article 15(2)) should be also adapted accordingly.

Insofar as the “sunrise clause” might have an impact on the flexibility mechanisms (i.e. banking/borrowing and pooling in Articles 17 and 18), the Presidency proposes to slightly adjust the relevant provision in this regard. Nevertheless, being such mechanisms voluntary (“may” provisions), implementing acts could specify the specific modalities of how banking/borrowing and pooling mechanisms would work for the purpose of compliance with the RFNBO sub-quota; and

In order to emphasise technological neutrality and to make the whole system more future proof, the Presidency proposes to also introduce an “**equivalence clause**”. This clause would allow the ship to reach the 2% sub-quota (if applicable) by demonstrating that it used equivalent fuels, other than RFNBO but with a similar or higher potential to decarbonise the maritime sector.

To give an indication to the delegations on how the new approach to the provisions on RFNBO could translate into concrete drafting suggestions, the Presidency draws delegations’ attention to Addendum 1 to the present report. Such concrete drafting suggestions are, at this stage, still preliminary and without prejudice to any further legal review.

- iii. the **requirements for OPS** and provisions relating to **zero-emission technologies**. In this respect, at the third informal trilogue, the co-legislators eventually acknowledged a common understanding to continue operating along the lines of work done at the technical level until then. Therefore, the Presidency hereby confirms the compromise suggestion reflected in the four-column document that was submitted to Coreper for preparations before the third informal trilogue (ST 6060/23+COR);

- iv. as regards the **certification of fuels**, at the third informal trilogue, the discussion confirmed that the co-legislators have the same stance, when it comes to excluding fossil fuels from the certification process, both for the Well-to-Tank (upstream) and Tank-to-Wake (downstream) emission phases. As regards the Well-to-Tank emission phase, while acknowledging that any certification process should be in line with Union legislation, the European Parliament requested to make an explicit reference to the recast Gas Directive, once adopted and where applicable. Therefore, the technical level worked to this end and a compromise solution is suggested in the annexed four-column document (lines 168a, 169, 170 and 170a);
- v. **the provisions on revenues generated from the remedial penalties and their allocation** were highly debated during the third informal trilogue since they are of extremely contentious nature. Therefore, the technical level further worked to reduce the gap. In this framework, the European Parliament eventually agreed to fully accept the calculation of the amount equal to the remedial penalties as proposed by the Council general approach. However, no convergence was found on the allocation of the revenues generated from the remedial penalties. In this respect, the European Parliament's technical level, proposed a mid-way solution putting in place a "dual" system so that: 1) revenues generated by the remedial penalties for non-compliance with GHG reduction targets would be allocated to the Innovation Fund; and 2) revenues generated by the remedial penalties for non-compliant port calls (OPS) would be allocated to the Member States. In this respect, the European Parliament also suggested that the receiving Member States should be the "port Member States", where the non-compliant port call took place, and not the "Administering States". This mid-way solution was discussed at the level of the Shipping Working Party and did not meet significant support. Therefore, the Presidency suggests maintaining the general approach in this respect. Nevertheless, guidance is sought as regards the possibility to introduce some transparency mechanisms allowing to monitor the revenue flow;

- vi. the **report and review clause**. In this respect, further to the third informal trilogue, the technical level further worked on this provision and the Presidency's compromise suggestions are reflected in the annexed four-column document, in lines 279-283u.

18. The Presidency is also seeking guidance as regards the following horizontal questions:

- **"implementing/delegated acts"**. There are a number of provisions in the text (e.g. Articles 12(5) and 13(3) in lines 192a and 196), where the Council defends the use of implementing acts and the European Parliament supports delegated acts. Therefore, any flexibility in this respect would be appreciated;⁴ and
- the use of the term **"remedial" penalty/ies**, as introduced by the Council general approach. Following concerns raised in the first place by the European Parliament as regards the legal clarity of the term, the matter has been discussed several times at the level of the Shipping Working Party. In this context, considering the difficulties expressed by some Member States as regards maintaining in the text only a simple reference to the term "penalty/ies", it was proposed by some delegation to use the term "FuelEU penalty/ies". This new term would allow contextualising this very specific (and new) type of penalties and, based on technical discussions with the European Parliament, could be accepted by this latter.⁵ Therefore, the Presidency suggests to replace the term "remedial penalties" with the term "FuelEU penalties".

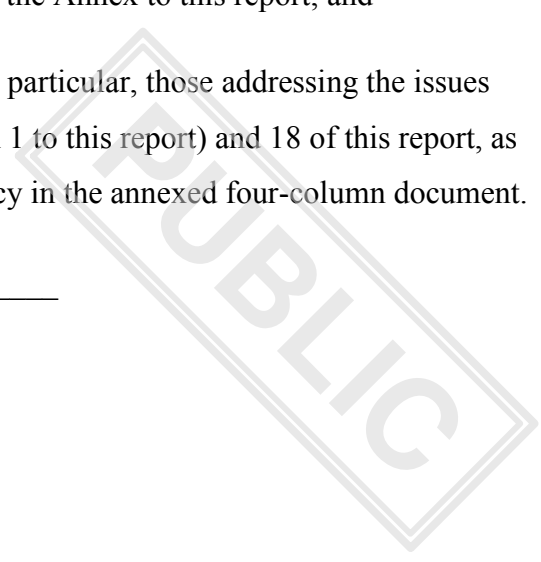

IV. CONCLUSION

19. In the light of the above and in view to conducting negotiations at the third informal trilogue, the Permanent Representatives Committee is invited to:

⁴ This would also include any implementing/delegated acts as referred to in Addendum 1 to this report. Therefore, any flexibility in this respect is also appreciated.

⁵ If delegations accept that "remedial penalties" is replaced by "FuelEU penalties", this latter will have to be introduced all over the text during the lawyer-linguist revision.

- grant its mandate on the lines marked in green in the Annex to this report; and
 - express its view as regards the other lines and, in particular, those addressing the issues recalled under points 16, 17 (including Addendum 1 to this report) and 18 of this report, as proposed in this note or presented by the Presidency in the annexed four-column document.

		Amendment 5		
		Recital 2 a (new)		
12a		<p><i>(2a) LNG is likely to play a transitional role in maritime transport, enabling a gradual transition towards zero-emission alternatives, especially where there is currently no economically viable zero-emission powertrain technology available. The Communication on the Smart and Sustainable Mobility Strategy points to zero-emission seagoing ships becoming market ready by 2030. Fleet conversion should take place gradually due to the long lifespan of the ships. Transport fuels such as LNG need increasingly to be decarbonised by blending with liquefied biomethane (bio-LNG) or renewable and low-carbon synthetic gaseous e-fuels (e-gas) for instance.</i></p>		EP agreed to drop its AM

		Amendment 23		
		Recital 11 a (new)		
21a		<i>(11a) In order to encourage the early market development and deployment of the most sustainable and innovative fuel technologies with growth</i>		<i>Recital on-hold – relating to RFNBO</i>

	Commission Proposal	EP Mandate	Council Mandate	Draft Agreement/Presidency comments
		<p><i>potential to meet future needs, a dedicated incentive for renewable fuels of non-biological origin (RFNBO) is necessary. This family of fuels has high potential to introduce renewable energy into the marine bunker fuel mix. In view of significantly higher production costs for RFNBOs in the short and medium terms, it is important to ensure a degree of demand that supports investment in such family of fuels. This Regulation introduces a combination of measures to ensure the support to the uptake of sustainable RFNBOs. These include (a) a multiplier until 2035 to reward companies that decide to opt for these fuels despite their relatively high price, and (b) from 2030 a fixed minimum share of RFNBOs in the fuel energy mix. To facilitate compliance with the minimum share of RFNBOs, flexibility measures according to Articles 17 and 18 of this Regulation should apply.</i></p>		

	Commission Proposal	EP Mandate	Council Mandate	Draft Agreement/Presidency comments
		<i>Companies can, by means of contractual arrangements, hold the fuel suppliers accountable for the compliance costs under this Regulation, if RFNBOs were not delivered according to agreed conditions.</i>		
Recital 12				
22	(12) Indirect land-use change occurs when the cultivation of crops for biofuels, bioliquids and biomass fuels displaces traditional production of crops for food and feed purposes. Such additional demand increases the pressure on land and can lead to the extension of agricultural land into areas with high-carbon stock, such as forests, wetlands and peatland, causing additional greenhouse gas emissions and loss of biodiversity. Research has shown that the scale of the effect depends on a variety of factors, including the type of feedstock used for fuel production, the level of additional demand for feedstock triggered by the use of biofuels, bioliquids and biomass fuels, and the extent to which land with high-carbon stock is protected worldwide. Member States shall notify such exemptions prior to their entry into force to the Commission, which shall publish them in the Official Journal of the European Union. No such exemptions shall apply beyond 31 December 2029.</i></p>		<p>Regulation 3577/92 under public service obligation or public service contract, operating before the entry into force of this Regulation, for the specific routes between their mainland ports of call and ports of call under their jurisdiction located in an island. No such exemptions shall apply beyond 31 December 2029.</p> <p>Member State shall notify such exemptions prior to their entry into force to the Commission, which shall publish them in the OJEU.</p> <p><i>See also line 65d</i></p> <p><i>The Presidency also suggests to add the following recital justifying this exception:</i></p> <p>"In addition to a general possibility for Member States to exempt voyages by passenger ships, other than cruise passenger ships, to islands with fewer than 200.000 permanent residents, a similar possibility should be granted to Member</p>

	Commission Proposal	EP Mandate	Council Mandate	Draft Agreement/Presidency comments
				States with regards to domestic voyages to islands, which are performed within the framework of a public service contract or subject to a public service obligation. Such obligations and contracts have been established by Member States in order to ensure an appropriate level of connectivity to island regions, at affordable prices, which would otherwise not have been achieved by market forces. Member States should be entitled to temporarily exempt such voyages by passenger ships between its mainland and an island of the same Member State, in order to retain the conditions under which the public service contracts or obligations were established and ensure the sustained connectivity, as well as economic, social and territorial cohesion of the select island regions."
		Amendment 63		
66o		Article 2 – paragraph 2 e (new)		
66p		<i>The Commission shall</i>		<i>Council, EP and Commission</i>

	Commission Proposal	EP Mandate	Council Mandate	Draft Agreement/Presidency comments
		<i>continuously monitor the impact of this Regulation on cargo diversion, in particular via transshipment ports in neighbouring countries. Where the Commission identifies major negative impacts on Union ports, the Commission shall submit legislative proposals to the European Parliament and to the Council to amend this Regulation. In particular, the Commission shall analyse the impact of this Regulation on outermost regions and islands, and shall, where appropriate, propose amendments to the scope of this Regulation.</i>		<i>agree to address this aspect in Article 28</i>

COMMISSION PROPOSAL

METHODOLOGY FOR ESTABLISHING THE GREENHOUSE GAS INTENSITY LIMIT ON THE ENERGY USED ON-BOARD BY A SHIP

For the purpose of calculating the greenhouse gas intensity limit of the energy used on-board a ship, the following formula, referred to as Equation (1) shall apply:

Equation (1)

GHG intensity index	WtT	TtW
$\text{GHG intensity index} \left[\frac{\text{gCO}_2\text{eq}}{\text{MJ}} \right] =$	$\frac{\sum_i^{\text{fuel}} M_{i,j} \times \text{CO}_{2\text{eq WtT},i} \times \text{LCV}_i + \sum_k^c E_k \times \text{CO}_{2\text{eq electricity},k}}{\sum_i^{\text{fuel}} M_{i,j} \times \text{LCV}_i + \sum_k^c E_k}$	$+ \frac{\sum_i^{\text{fuel}} \sum_j^{\text{engine}} M_{i,j} \times \left(1 - \frac{1}{100} C_{\text{engine slip } j} \right) \times (\text{CO}_{2\text{eq TtW},j}) + \left(\frac{1}{100} C_{\text{engine slip } j} \times \text{CO}_{2\text{eq TtW,slippage},j} \right)}{\sum_i^{\text{fuel}} M_{i,j} \times \text{LCV}_i + \sum_k^c E_k}$

where the following formula is referred to as Equation (2):

$$\text{CO}_{2\text{eq TtW},j} = (C_{f \text{CO}_2,j} \times \text{GWP}_{\text{CO}_2} + C_{f \text{CH}_4,j} \times \text{GWP}_{\text{CH}_4} + C_{f \text{N}_2\text{O},j} \times \text{GWP}_{\text{N}_2\text{O}}) \times \text{Equation (2)}$$

Term	Explanation
i	Index corresponding to the fuels delivered to the ship in the reference period
j	Index corresponding to the fuel combustion units on board the ship. For the purpose of this Regulation the units considered are the main engine(s), auxiliary engine(s) and fired oil boilers
k	Index corresponding to the connection points (c) where electricity is supplied per connection point.
c	Index corresponding to the number of electrical charging points
m	Index corresponding to the number of energy consumers
$M_{i,j}$	Mass of the specific fuel i oxidised in consumer j [gFuel]
E_k	Electricity delivered to the ship <i>per</i> connection point k if more than one [MJ]
$\text{CO}_{2\text{eq WtT},i}$	WtT GHG emission factor of fuel i [gCO _{2eq} /MJ]
$\text{CO}_{2\text{eq electricity},k}$	WtT GHG emission factor associated to the electricity delivered to the ship at berth <i>per</i> connection point k [gCO _{2eq} /MJ]
LCV_i	Lower Calorific Value of fuel i [MJ/gFuel]
$C_{\text{engine slip } j}$	Engine fuel slippage (non-combusted fuel) coefficient as a percentage of the mass of the fuel i used by combustion unit j [%]
$C_{f \text{CO}_2,j}, C_{f \text{CH}_4,j}, C_{f \text{N}_2\text{O},j}$	TtW GHG emission factors by combusted fuel in combustion unit j [gGHG/gFuel]
$\text{CO}_{2\text{eq TtW},j}$	TtW CO ₂ equivalent emissions of combusted fuel i in combustion unit j [gCO _{2eq} /gFuel] $\text{CO}_{2\text{eq TtW},j} = (C_{f \text{CO}_2,j} \times \text{GWP}_{\text{CO}_2} + C_{f \text{CH}_4,j} \times \text{GWP}_{\text{CH}_4} + C_{f \text{N}_2\text{O},j} \times \text{GWP}_{\text{N}_2\text{O}}) \times$
$C_{sf \text{CO}_2,j}, C_{sf \text{CH}_4,j}, C_{sf \text{N}_2\text{O},j}$	TtW GHG emissions factors by slipped fuel towards combustion unit j [gGHG/gFuel]
$\text{CO}_{2\text{eq TtW,slippage},j}$	TtW CO ₂ equivalent emissions of slipped fuel i towards combustion unit j [gCO _{2eq} /gFuel] $\text{CO}_{2\text{eq TtW,slippage},j} = (C_{sf \text{CO}_2,j} \times \text{GWP}_{\text{CO}_2} + C_{sf \text{CH}_4,j} \times \text{GWP}_{\text{CH}_4} + C_{sf \text{N}_2\text{O},j} \times \text{GWP}_{\text{N}_2\text{O}}) \times$
$\text{GWP}_{\text{CO}_2}, \text{GWP}_{\text{CH}_4}, \text{GWP}_{\text{N}_2\text{O}}$	CO ₂ , CH ₄ , N ₂ O Global Warming Potential over 100 years

In the case of fossil fuels, the default values in Annex II shall be used.

For the purpose of this regulation the term $\sum_k^c E_k \times \text{CO}_{2\text{eq electricity},k}$ in the numerator of Equation (1) shall be set to zero.

Method for determining [M_i]

The [M_i] mass of fuel shall be determined using the amount reported in accordance with the framework of the reporting under Regulation (EU) 2015/757 for voyages falling within the scope of this Regulation based on the chosen monitoring methodology by the company.

Method for determining WtT GHG factors

For non-fossil fuels, wherever values different from the default values in Annex II are used, these shall be based on relevant Bunker Delivery Notes (BDNs), for the fuels delivered to the ship in the reference period, for at least equal quantities of fuels as the one determined as being consumed in scope of the regulated journey in accordance with point A.

The WtT GHG ($\text{CO}_{2\text{eq WtT},i}$) of the fuels (which are not fossil fuels) are established in Directive (EU) 2018/2001. The actual values, contained in the Directive that shall be used for the purpose of this Regulation, in accordance with the methodology, are those without combustion¹¹. For those

¹¹ Reference is made to Directive (EU) 2018/2001, Annex V.C.1.(a) to the term e_u ‘emissions from the fuel in use’

fuels for which pathways are not included in the Directive and for fossil fuels, the WtT GHG emission factors ($CO_{2eq\ WtT,i}$) default values are contained in Annex II.

Fuel Bunker Delivery Note (BDN)

For the purposes of this regulation, relevant BDNs of fuels used on board shall contain at least the following information:

product identification

- fuel mass [t]
- fuel volume [m³]
- fuel density [kg/m³]
- WtT GHG emission factor for CO₂ (carbon factor) [gCO₂/gFuel] and for CO_{2eq} [gCO_{2eq}/gFuel] and related certificate¹²
- Lower Calorific Value [MJ/g]

BDN Electricity

For the purposes of this regulation, relevant BDNs for electricity delivered to the ship shall contain at least the following information:

- supplier: name, address, telephone, email, representative
- receiving ship: IMO number (MMSI), ship name, ship type, flag, ship representative
- port: name, location (LOCODE), terminal/ berth
- connection point: OPS-SSE connection point, connection point details
- connection time: date/time of commencement/finalisation
- energy supplied: power fraction allocated to supply point (if applicable) [kW], electricity consumption (kWh) for the billing period, peak power information (if available)
- metering

Method for determining TtW GHG factors

The TtW emissions are determined on the basis of the methodology contained in this Annex as provided in Equation (1) and Equation (2)

For the purpose of this Regulation, the TtW GHG emission factors ($CO_{2eq\ TtW,j}$) that shall be used to determine the GHG emissions are contained in Annex II. The CO₂ C_f factors shall be the ones established in Regulation (EU) 2015/757 and are reported in the Table for easy reference. For fuels whose factors are not included in the said regulation, default factors as contained in Annex II shall be used.

In accordance with its compliance plan referred to in Article 6 and upon assessment by the verifier, other methods, such as direct CO_{2eq} measurement, laboratory testing, may be used if it enhances the overall accuracy of the calculation.

Method for determining TtW fugitive emissions

Fugitive emissions are emissions caused by the amount of fuel that does not reach the combustion chamber of the combustion unit or that is not consumed by the energy converter because they are uncombusted, vented, or leaked from the system. For the purpose of this Regulation, fugitive emissions are taken into account as a percentage of the mass of the fuel used by the engine. The default values are contained in Annex II.

¹² This value is not required in case of fossil fuels referred to in Annex II. For all other fuels, including blends of fossil fuels, this value should be made available together with a separate certificate identifying the fuel production pathway.

Methods for determining the reward factors linked to substitute sources of energy

In case substitute sources of energy are installed on board, a reward factor for substitute sources of energy can be applied. In case of wind power such reward factor is determined as follow:

Reward factor for substitute sources of energy- WIND (f_{wind})	$\frac{P_{Wind}}{P_{Tot}}$
0,99	0,1
0,97	0,2
0,95	$\geq 0,3$

The ship GHG intensity index is then calculated by multiplying the result of Equation (1) by the reward factor.

Verification and Certification

Fuel Class	WtT	TtW
Fossil	Default values shall be used as provided in Table 1 of this Regulation	MRV Regulation CO ₂ carbon factors shall be used for fuels for which such factor is provided For all other emissions factors, default values can be used as provided in Table 1 of this Regulation, alternatively Certified values by mean of laboratory testing or direct emissions measurements
Sustainable Renewable Fuels (Bio Liquids, Bio Gases, e-Fuels)	CO _{2eq} values as provided in RED II (without combustion) can be used for all fuels whose pathways are included in RED II, alternatively RED II approved certification scheme can be used	Emissions factors, default values can be used as provided in Table 1 of this Regulation, alternatively Certified values by mean of laboratory testing or direct emissions measurements.
Others (including electricity)	CO _{2eq} values as provided in RED II (without combustion) can be used for all fuels whose pathways are included in RED II, alternatively RED II approved certification scheme can be used	Emissions factors, default values can be used as provided in Table 1 of this Regulation, alternatively Certified values by mean of laboratory testing or direct emissions measurements.

The emissions factors for fossils fuels contained in this Annex shall be used for the determination of the greenhouse gas intensity index referred to in Annex I of this Regulation.

The emissions factors of biofuels, biogas, renewable fuels of non-biological origin and recycled carbon fuels shall be determined according to the methodologies set out in Annex 5 part C of Directive (EU) 2018/2001.

In the table:

- TBM stands for To Be Measured
- N/A stands for Not Available
- The dash means not applicable

Column 1 identifies the class of the fuels namely Fossils, Liquid Biofuels, Gaseous Biofuels, e-Fuels;

Column 2 identifies the name or the pathway of the relevant fuels within the class. For the Liquid Biofuels, Gaseous Biofuels, RFNBO (e-Fuels) the values for the WtT section shall be taken from Directive (EU) 2018/2001 (without combustion¹³); for fossils fuels only the default values in the table shall be used.

Column 3 contains the Lower Calorific Value of the fuels expressed in [MJ/g].

Column 4 contains the CO_{2eq} emissions values in [gCO_{2eq}/MJ]. For fossils fuels only the default values in the table shall be used. For all other fuels, (except were expressly indicated), values shall be calculated by using the methodology or the default values as per in Directive (EU) 2018/2001 deducted of the combustion emissions considering full oxidation of the fuel¹⁴.

Column 5 identifies the main types/classes of energy converters such as 2 and 4 strokes Internal Combustion Engines (ICE) Diesel or Otto cycle, gas turbines, fuels cells etc.

Column 6 contains the emission factor C_f for CO₂ in [gCO₂/gfuel]. Emissions factors values as specified in the Regulation (EU) 2015/757 (or IMO MEPC245 (66) as amended) shall be used. For all those fuels not contained in Regulation (EU) 2015/757, the default values contained in the table should be used. Values certified by a by a trusted certifier (under the relevant provisions made in Directive (EU) 2018/2001) can be used in place of the default values.

¹³ Reference is made to Directive (EU) 2018/2001, Annex V.C.1.(a) to the term e_u ‘emissions from the fuel in use’.

¹⁴ Reference is made to Directive (EU) 2018/2001, Annex V.C.1.(a) to the term e_u ‘emissions from the fuel in use’

Column 7 contains the emission factor C_f for methane in $[gCH_4/g_{fuel}]$. Default values as contained in the table shall be used. Values certified by mean of testing can be used in place of the default values. For LNG fuels C_f for methane are set to zero.

Column 8 contains the emission factor C_f for nitrous oxide in $[gN_2O/g_{fuel}]$. Default values as contained in the table shall be used. Values certified by mean of testing can be used in place of the default values.

Column 9 identifies the part of fuel lost as fugitive emissions (C_{slip}) measure as % of mass of fuel used by the specific energy converter. Default values as contained in the table shall be used. Values certified by mean of testing can be used in place of the default values. For fuels such as LNG for which the fugitive emissions (slip) exists, the amount of fugitive emissions as presented in Table 1 is expressed in % of the mass of fuel used (Column 9). The values contained in Column 9 shall be used, in accordance with equation (1). The values of C_{slip} in Table (1) are calculated at 50% of the engine load.

ANNEX III

CRITERIA FOR THE USE OF ZERO-EMISSION TECHNOLOGY AS REFERRED TO IN ARTICLES 5(3)(b) and 7(3), points (d) and (f)

The following table provides a list of zero-emission technologies as referred to in Article 5(3)(b), as well as, specific criteria for their use as applicable.

Zero-emission technology	Criteria for use
Fuel cells	Fuel cells used on board for power generation while at berth should be fully powered by renewable and low carbon fuels.
On-board Electricity Storage	The use of on-board electricity storage is allowed irrespective on the source of energy that produced the stored power (on-board generation or on-shore in case of battery swapping).
On-board Electricity production from wind and solar energy	Any ship that is capable to sustain energy needs at berth through the use of wind and solar energy.

The use of these zero-emission technologies shall continuously achieve emissions that are equivalent to the emissions reductions that would be achieved by using on-shore power supply.

**CERTIFICATE TO BE ISSUED BY THE MANAGING BODY OF THE PORT OF CALL IN
CASES WHERE SHIPS CANNOT MAKE USE OF OPS FOR JUSTIFIED REASONS
(ARTICLE 5(5)) - MINIMUM ELEMENTS TO BE INCLUDED IN THE CERTIFICATE**

For the purposes of this Regulation, the certificate referred to in Article 5(5) shall contain at least the following information:

Ship identification

- (a) IMO number
- (b) Ship name
- (c) Call sign
- (d) Ship type
- (e) Flag
- (2) Port of call

Location/terminal name

Arrival date and time (ATA)

Departure date and time (ATD)

The confirmation from the managing body of the port that the ship was found among any of the following cases:

- the ship made an unscheduled port call for reasons of safety or saving life at sea (Article 5(2), point (c))
- the ship was unable to connect to on-shore power supply due to unavailable connection points in the port (Article 5(2), point (d))
- the on-shore power supply equipment on board was found to be incompatible with the shore installation at the port (Article 5(2), point (e))
- that the ship used, for a limited period of time on-board energy generation, under emergency situations representing immediate risk to life, the ship, or the environment (Article 5(2), point (f)).

Details of the managing body of the port

Name

contact (phone, email)

Date of issue

FORMULAS FOR CALCULATING THE COMPLIANCE BALANCE AND PENALTY LAID DOWN IN ARTICLE 20(1)

Formula for calculating the ship's compliance balance

For the purpose of calculating the compliance balance of a ship the following formula shall apply:

Compliance balance [gCO _{2eq} /MJ] =	$(GHGIE_{target} - GHGIE_{actual}) \times [\sum_i^{fuel} M_i \times LCV_i + \sum_i^l E_i]$
---	--

Where:

gCO_{2eq}	Grams of CO ₂ equivalent
$GHGIE_{target}$	Greenhouse gas intensity limit of the energy used on-board a ship according to Article 4(2) of this Regulation
$GHGIE_{actual}$	Yearly average of the greenhouse gas intensity of the energy used on-board a ship calculated for the relevant reporting period

Formula for calculating the penalty laid down in Article 20(1)

The amount of the penalty laid down in Article 20(1) shall be calculated as follows:

Penalty =	$(Compliance\ balance / GHGIE_{actual}) \times conversion\ factor\ from\ MJ\ to\ tonnes\ of\ VLSFO\ (41.0\ MJ / kg) \times EUR\ 2400$
-----------	---

Amendment

M_{i,j} A

Adjusted mass of the specific fuel i oxidized in consumer j [gFuel] due to sailing in ice conditions in the case of a ship in ice class IC, IB, IA or IA Super or in an equivalent ice class^{1a} and due to technical properties of a ship in ice class IA or IA Super or in an equivalent ice class. The adjusted mass M_{i,j} A is used in Equation (1) instead of the mass M_{i,j} when appropriate.

^{1a} ***For further information on correspondence between ice classes, see HELCOM Recommendation 25/7 at <http://www.helcom.fi>.***

Amendment 154

Proposal for a regulation
Annex I – paragraph 4 – introductory part

Text proposed by the Commission

In the case of fossil fuels, the default values in Annex II shall be used.

Amendment

In the case of fossil fuels, the default values in Annex II shall be used ***unless actual values can be provided by means of certification or direct emissions measurements.***

Amendment 155

Proposal for a regulation
Annex I – paragraph 4 – subparagraph 1 – introductory part

Text proposed by the Commission

For the purpose of this regulation the term $\Sigma E_k \times CO_{2eq} \text{ electricity}$, in the numerator of Equation (1) shall be set to zero.

Amendment

For the purpose of this regulation the term $\Sigma E_k \times CO_{2eq} \text{ electricity}$, in the numerator of Equation (1) shall be set to zero.

The term MULT in the denominator of Equation (1) shall be set to the value of the RFNBO multiplier as referred to in Article 4a (2) in accordance with Article 9

(1 b). For all other fuels, the multiplier shall be set to one.

Amendment 156

Proposal for a regulation Annex I – paragraph 5

Text proposed by the Commission

The $[M_i]$ mass of fuel shall be determined using the amount reported in accordance with the framework of the reporting under Regulation (EU) 2015/757 for voyages falling within the scope of this Regulation based on the chosen monitoring methodology by the company.

Amendment

The mass **$[M_i]$** of fuel shall be determined using the amount reported in accordance with the framework of the reporting under Regulation (EU) 2015/757 for voyages falling within the scope of this Regulation based on the chosen monitoring methodology by the company. ***The adjusted mass of fuel $[M_{iA}]$ may be used instead of the mass of fuel $[M_i]$ for a ship having the ice class IC, IB, IA or IA Super or an equivalent ice class. The adjusted mass $[M_{iA}]$ is defined in Annex Va.***

Amendment 157

Proposal for a regulation Annex I – paragraph 12

Text proposed by the Commission

In accordance with its compliance plan referred to in Article 6 and upon assessment by the verifier, other methods, such as direct CO_{2eq} measurement, ***laboratory testing***, may be used if it enhances the overall accuracy of the calculation.

Amendment

In accordance with its compliance plan referred to in Article 6 and upon assessment by the verifier, other methods, such as direct CO_{2eq} measurement may be used if it enhances the overall accuracy of the calculation.

ANNEX V

**FORMULAS FOR CALCULATING THE COMPLIANCE BALANCE AND PENALTY
LAID DOWN IN ARTICLE 20(1)**

Formula for calculating the ship's compliance balance

For the purpose of calculating the compliance balance of a ship the following formula shall apply:

Compliance balance [gCO _{2eq} /MJ] =	$(GHGIE_{\text{target}} - GHGIE_{\text{actual}}) \times [\sum_i^n \text{fuel} M_i \times LCV_i + \sum_i^l E_i]$
--	---

Where:

gCO_{2eq}	Grams of CO ₂ equivalent
GHGIE _{target}	Greenhouse gas intensity limit of the energy used on-board a ship according to Article 4(2) of this Regulation
GHGIE _{actual}	Yearly average of the greenhouse gas intensity of the energy used on-board a ship calculated for the relevant reporting period

Formula for calculating the penalty laid down in Article 20(1)

The amount of the penalty laid down in Article 20(1) shall be calculated as follows:

Penalty =	$(\text{Compliance balance} / GHGIE_{\text{actual}}) \times \text{conversion factor from MJ to tonnes of VLSFO (41.0 MJ / kg)} \times \text{EUR 2400}$
-----------	--

Amendment

ANNEX V

FORMULAS FOR CALCULATING THE COMPLIANCE BALANCE AND *REMEDIAL*

PENALTY LAID DOWN IN ARTICLE 20(1)

A. Formula for calculating the ship's compliance balance

a) *Compliance Balance with respect to greenhouse gas intensity of the ship, in respect to Article 4.2*

For the purpose of calculating the compliance balance of a ship the following formula shall apply:

Compliance balance [gCO _{2eq} /MJ] =	$(GHGIE_{\text{target}} - GHGIE_{\text{actual}}) \times [\sum_i^n \text{fuel} M_i \times LCV_i + \sum_i^l E_i]$
--	---

Where:

gCO_{2eq}	Grams of CO ₂ equivalent
GHGIE _{target}	Greenhouse gas intensity limit of the energy used on-board a ship according to Article 4(2) of this Regulation
GHGIE _{actual}	Yearly average of the greenhouse gas intensity of the energy used on-board a ship calculated for the relevant reporting period

b) *Compliance Balance with respect to RFNBO quota, in respect to Article 4a (3)*

$CB_RFNBO [\% RFNBO] =$	$(\% RFNBO_{\text{quota}} - \% RFNBO_{\text{actual}})$
--------------------------	--

Where :

CB_RFNBO	<i>Compliance Balance with respect to RFNBO_{quota}, in respect to Article 4a(3)</i>
$\% RFNBO_{\text{quota}}$	<i>RFNBO_{quota} of the yearly average energy used on-board a ship according to Article 4a(3) of this Regulation</i>
$\% RFNBO_{\text{actual}}$	<i>Percentage of the yearly average energy used on-board reported by a ship that is actually met with RFNBOs compliant with Article 9(1)(b)</i>

B. Formula for calculating the penalty laid down in Article 20(1)

a) *Remedial Penalty with respect to compliance balance for greenhouse gas intensity of the ship, in respect to Article 4.2*

The amount of the penalty laid down in Article 20(1) shall be calculated as follows:

Penalty =	$(\text{Compliance balance} / GHGIE_{\text{actual}}) \times \text{conversion factor from MJ to tonnes of VLSFO (41.0 MJ / kg)} \times \text{EUR 2400}$
-----------	--

b) *Remedial Penalty with respect to RFNBO quota, with respect to Article 4a(3)*

The amount of the remedial penalty laid down in Article 20(1a) shall be calculated as follows:

<i>Remedial Penalty (RFNBO) =</i>	<i>$abs(CB_RFNBO) \times Pd \times 3$</i>
-----------------------------------	---

Where:

<i>Remedial Penalty</i>	<i>in EUR</i>
<i>$abs(CB_RFNBO)$</i>	<i>Is the absolute value of the compliance balance for RFNBO</i>

<i>Pd</i>	<i>Price difference between RFNBOs and fossil fuel compatible with ship installation</i>
-----------	--

Amendment 164

Proposal for a regulation Annex V a (new)

Text proposed by the Commission

Amendment

ANNEX Va

CALCULATION OF ADJUSTED MASS OF FUEL AND OF ADDITIONAL ENERGY

First, this Annex describes how to calculate the adjusted mass of fuel using the additional energy due to technical characteristics of a ship in ice class IA or IA Super or in an equivalent ice class^{1a} and the additional energy used by a ship in ice class IC, IB, IA or IA Super or in an equivalent ice class due to sailing in ice conditions. Second, it describes how to calculate the additional energies.

Adjusted mass [Mj A]

The [Mi A] adjusted mass of fuel shall be calculated on the basis of the additional energy used for sailing in ice conditions and the additional energy used due to technical properties of a ship in ice class IA or IA Super or in an equivalent ice class. The company may choose to which fuel i the additional energy is allocated. The selected fuel i must be one of the fuels that the ship has consumed during the reporting period. The amount of the energy corresponding to the consumed mass of the fuel i may be lower than the amount of the additional energy.

The [Mi A] adjusted mass of fuel i shall be calculated as follows

$$M_{iA} = M_{i\text{ total}} - M_{i\text{ additional due to ice class}} - M_{i\text{ additional due to ice conditions}}, \quad (\text{Ax.1})$$

where $M_{i\text{ total}}$ denotes the total mass of fuel i, $M_{i\text{ additional due to ice class}}$ the mass of fuel due to additional energy consumption of a ship in ice class IA or IA Super or in an equivalent ice class and $M_{i\text{ additional due to ice conditions}}$ the mass of fuel due to additional energy consumption due to sailing in ice conditions.

The mass of fuel i representing the additional energy consumption due to technical characteristics of a ship in ice class IA or IA Super or in an equivalent ice class is calculated with

$$M_{i\text{ additional due to ice class}} = \frac{E_{\text{additional due to ice class}}}{LCV_i}, \quad (\text{Ax.2})$$

where $E_{\text{additional due to ice class}}$ is the additional energy consumption due to the technical characteristics of a ship in ice class IA or IA Super or in an equivalent ice class and LCV_i is the lower caloric value of the fuel i.

Similarly, the mass of fuel due to additional energy consumption due to sailing in ice conditions is calculated using

$$M_{i \text{ additional due to ice conditions}} = \frac{E_{\text{additional due to ice conditions}}}{LCV_i}, \quad (\text{Ax.3})$$

where $E_{\text{additional due to ice conditions}}$ is the additional energy consumption due to sailing in ice conditions.

Additional energy due to ice class and due to sailing in ice conditions

The additional energy consumption due to the technical characteristics of a ship in ice class IA or IA Super or in an equivalent ice class shall be calculated as follows

$$E_{\text{additional due to ice class}} = 0.05 \times (E_{\text{voyages, total}} - E_{\text{additional due to ice conditions}}), \quad (\text{Ax.4})$$

where $E_{\text{voyages, total}}$ denotes the total energy consumed for all voyages and $E_{\text{additional due to ice conditions}}$ additional energy consumption due to sailing in ice conditions.

The total energy consumed for all voyages shall be calculated using

$$E_{\text{voyages, total}} = \sum_{i=1}^{n \text{ fuel}} M_{i, \text{voyages, total}} \times LCV_i + E_{\text{elect., voyages, total}}, \quad (\text{Ax.5})$$

where $M_{i, \text{voyages, total}}$ denotes the mass of fuel i consumed for all voyages within the scope of this Regulation, LCV_i the lower caloric value of fuel i and $E_{\text{elect., voyages, total}}$ the amount of the electricity delivered to the ship consumed for all voyages.

The mass of fuel i $M_{i, \text{voyages, total}}$ consumed for all voyages within the scope of this Regulation is calculated with

$$M_{i, \text{voyages, total}} = M_{i, \text{voyages between MS}} + 0.5 \cdot (M_{i, \text{voyages from MS}} + M_{i, \text{voyages to MS}}), \quad (\text{Ax.6})$$

where $M_{i, \text{voyages between MS}}$ denotes the aggregated mass of fuel consumed during all voyages between ports under a Member State's jurisdiction, $M_{i, \text{voyages from MS}}$ the aggregated mass of fuel consumed during all voyages which departed from ports under a Member State's jurisdiction and $M_{i, \text{voyages to MS}}$ the aggregated mass of fuel consumed during voyages to ports under a Member State's jurisdiction. The consumed amount of the electricity delivered to the ship $E_{\text{elect., voyages total}}$ can be calculated in the same way.

The additional energy consumption due to sailing in ice conditions e calculated as follows

$$E_{\text{additional due to ice conditions}} = E_{\text{voyages, total}} - E_{\text{voyages, open water}} - E_{\text{voyages, ice conditions, adjusted}}, \quad (\text{Ax.7})$$

where $E_{\text{voyages, open water}}$ denotes the energy consumed on voyages in open water and $E_{\text{voyages, ice conditions, adjusted}}$ the adjusted energy consumed in ice conditions.

The energy consumed for voyages that include sailing in open water only e calculated as follows

$$E_{\text{voyages, open water}} = E_{\text{voyages, total}} - E_{\text{voyages, ice conditions}} \quad (\text{Ax.8})$$

where $E_{\text{voyages, ice conditions}}$ denotes energy consumed for sailing in ice conditions, which is calculated as follows

$$E_{\text{voyages, ice conditions}} = \sum_{i=1}^{n \text{ fuel}} M_{i, \text{voyages, ice conditions}} \times LCV_i + E_{\text{elect., ice conditions}} \quad (\text{Ax.9})$$

where $M_{i, \text{voyages, ice conditions}}$ denotes the mass of fuel i consumed for sailing in ice conditions and $E_{\text{elect., voyages, total}}$ denotes the amount of the electricity delivered to the

ship consumed when sailing in ice conditions.

The mass of fuel i consumed for sailing in ice conditions is defined as follows

$$M_{i, \text{voyages, ice cond.}} = M_{i, \text{voyages between MS, ice cond.}} + 0.5 \cdot (M_{i, \text{voyages from MS, ice cond.}} + M_{i, \text{voyages to MS, ice cond.}}), \quad (\text{Ax.10})$$

where $M_{i, \text{voyages between MS, ice cond.}}$ denotes the aggregated mass of fuel consumed by an ice class ship when sailing in ice conditions between ports under a Member State's jurisdiction, $M_{i, \text{voyages from MS}}$ the aggregated mass of fuel consumed by an ice class ship when sailing in ice conditions during all voyages which departed from ports under a Member State's jurisdiction and $M_{i, \text{voyages to MS}}$ the aggregated mass of fuel consumed by an ice class ship when sailing in ice conditions during voyages to ports under a Member State's jurisdiction. The consumed amount of the electricity delivered to the ship E in ice conditions can be calculated in the same way.

The adjusted energy consumed in ice conditions shall be calculated using

1)

$$E_{\text{voyages, ice conditions, adjusted}} = D_{\text{ice conditions}} \times \left(\frac{E}{D}\right)_{\text{open water}} \quad (\text{Ax.11})$$

with the distance travelled when sailing in ice conditions $D_{\text{ice conditions}}$ and energy consumption per distance travelled in open water $\left(\frac{E}{D}\right)_{\text{open water}}$.

The distance travelled when sailing in ice conditions $D_{\text{ice conditions}}$ shall be calculated as follows

$$D_{\text{ice cond.}} = D_{\text{voyages between MS, ice cond.}} + 0.5 \cdot (D_{\text{voyages from MS, ice cond.}} + D_{\text{voyages to MS, ice cond.}}), \quad (\text{Ax.12})$$

where $D_{\text{voyages between MS, ice cond.}}$ denotes the aggregated distance travelled when sailing in ice conditions between ports under a Member State's jurisdiction, $D_{\text{voyages from MS}}$ the aggregated distance when sailing in ice conditions during all voyages which departed from ports under a Member State's jurisdiction and $D_{\text{voyages to MS}}$ the aggregated distance when sailing in ice conditions during voyages to ports under a Member State's jurisdiction.

The latter is defined as follows:

$$\left(\frac{E}{D}\right)_{\text{open water}} = \frac{E_{\text{voyages, total}} - E_{\text{voyages, ice conditions}}}{D_{\text{total}} - D_{\text{ice conditions}}}, \quad (\text{Ax.13})$$

where $E_{\text{voyages, ice conditions}}$ denotes the energy consumption when sailing in ice conditions and D_{total} the total annual distance travelled.

The total annual distance travelled shall be calculated as follows

$$D_{\text{total}} = D_{\text{voyages between MS}} + 0.5 \cdot (D_{\text{voyages from MS}} + D_{\text{voyages to MS}}), \quad (\text{Ax.14})$$

where $D_{\text{voyages between MS}}$ denotes the aggregated distance travelled between ports under a Member State's jurisdiction, $D_{\text{voyages from MS}}$ the aggregated distance travelled during all voyages which departed from ports under a Member State's jurisdiction and $D_{\text{voyages to MS}}$ the aggregated distance travelled during voyages to ports under a Member State's jurisdiction.

^{1a} For further information on correspondence between ice classes, see HELCOM Recommendation 25/7 at <http://www.helcom.fi>.

**METHODOLOGY FOR ESTABLISHING THE GREENHOUSE GAS INTENSITY ~~LIMIT~~ OF
THE ENERGY USED ON-BOARD BY A SHIP**

For the purpose of calculating the greenhouse gas intensity ~~limit~~ of the energy used on-board by a ship, the following formula, referred to as Equation (1) shall apply:

GHG intensity index	WtT	TtW
GHG intensity index $\left[\frac{\text{gCO}_2\text{eq}}{\text{MJ}} \right] =$	$\frac{\sum_i^{n \text{ fuel}} M_i \times \text{CO}_{2\text{eq WtT},i} \times \text{LCV}_i + \sum_k E_k \times \text{CO}_{2\text{eq electricity},k}}{\sum_i^{n \text{ fuel}} M_i \times \text{LCV}_i \times \text{RWD}_i + \sum_k E_k}$	$\frac{\sum_i^{n \text{ fuel}} \sum_j^{m \text{ engine}} M_{i,j} \times \left[\left(1 - \frac{1}{100} C_{\text{engine slip } j} \right) \times (\text{CO}_{2\text{eq TtW},j}) + \left(\frac{1}{100} C_{\text{engine slip } j} \right) \times \text{CO}_{2\text{eq TtW,slippage},j} \right]}{\sum_i^{n \text{ fuel}} M_i \times \text{LCV}_i \times \text{RWD}_i + \sum_k E_k}$

Equation (1)

where the following formula is referred to as Equation (2):

$$\text{CO}_{2\text{eq TtW},j} = \left(C_{f\text{CO}_2,j} \times \text{GWP}_{\text{CO}_2} + C_{f\text{CH}_4,j} \times \text{GWP}_{\text{CH}_4} + C_{f\text{N}_2\text{O},j} \times \text{GWP}_{\text{N}_2\text{O}} \right)_i \text{ Equation (2)}$$

Term	Explanation
<i>i</i>	Index corresponding to the fuels delivered to the ship in the reporting referencee period
<i>j</i>	Index corresponding to the fuel consumer combustion units on board the ship. For the purpose of this Regulation the fuel consumer units considered are the main engine(s), auxiliary engine(s), and fired oil boilers, fuel cells and waste incinerators
<i>k</i>	Index corresponding to the on-shore power supply connection points electrical-charging connection points (c) where electricity is supplied per connection point.
<i>n</i>	Total number of fuels delivered to the ship in the reporting period
<i>c</i>	Total number of on-shore power supply connection points Index corresponding to the number of electrical charging points
<i>m</i>	Total number of fuel consumer units Index corresponding to the number of energy fuel consumers
$M_{i,j}$	Mass of the specific fuel <i>i</i> oxidised in consumed by fuel consumer unit <i>j</i> [gFuel]
E_k	Electricity delivered to the ship <i>per</i> electrical-charging connection on-shore power supply connection point <i>k</i> if more than one [MJ]
$\text{CO}_{2\text{eq WtT},i}$	WtT GHG emission factor of fuel <i>i</i> [gCO _{2eq} /MJ]
$\text{CO}_{2\text{eq electricity},k}$	WtT GHG emission factor associated to the electricity delivered to the ship at berth <i>per</i> electrical-charging connection on-shore power supply connection point <i>k</i> [gCO _{2eq} /MJ]

LCV_i	Lower Calorific Value of fuel i [MJ/gFuel]
RWD_i	In the case the fuel i of non-biological origin, a reward factor of 2 from 1 January 2025 to 31 December 2034 can be applied. Otherwise $RWD_i = 1$.
$C_{engineslipj}$	Engine fuel slippage (non-combusted fuel) coefficient as a percentage of the mass of the fuel i consumed used by combustion fuel consumer unit j [%]. C_{slip} includes fugitive emissions (emissions before the “engine”) and slipped emissions.
$C_{fCO_2,j}, C_{fCH_4,j}, C_{fN_2}$	TtW GHG emission factors by combusted fuel in fuel consumer combustion unit j [gGHG/gFuel]
$CO_{2eq,TtW,j}$	TtW CO ₂ equivalent emissions of combusted fuel i in fuel consumer combustion unit j [gCO ₂ eq/gFuel] $CO_{2eq,TtW,j} = (C_{fCO_2,j} \times GWP_{CO_2} + C_{fCH_4,j} \times GWP_{CH_4} + C_{fN_2O,j} \times GWP_{N_2O})_i$
$C_{sfCO_2,j}, C_{sfCH_4,j}, C_{sfN_2O,j}$	TtW GHG emission factors by slipped fuel towards combustion fuel consumer unit j [gGHG/gFuel]
$CO_{2eq,TtWslippage,j}$	TtW CO ₂ equivalent emissions of slipped fuel i towards fuel consumer combustion unit j [gCO ₂ eq/gFuel] $CO_{2eq,TtWslippage,j} = (C_{sfCO_2,j} \times GWP_{CO_2} + C_{sfCH_4,j} \times GWP_{CH_4} + C_{sfN_2O,j} \times GWP_{N_2O})_i$ where: C_{sfCO_2} and C_{sfN_2O} are set to zero.
$GWP_{CO_2}, GWP_{CH_4}, GWP_{N_2O}$	CO ₂ , CH ₄ , N ₂ O Global Warming Potential over 100 years, which are: $GWP_{CO_2} = 1$; $GWP_{CH_4} = 29,8$; $GWP_{N_2O} = 273$ defined in Directive (EU) 2018/2001, Paragraph 4 of Part C of Annex V

~~In the case of fossil fuels, the default values in Annex II shall be used.~~

~~For the purpose of this regulation the term $\sum_k^C E_k \times CO_{2eq_{electricity,k}}$ in the numerator of Equation (1) shall be set to zero.~~

Method for determining [Mi]

The [Mi] mass of fuel shall be determined using the amount reported in accordance with the framework of the reporting under Regulation (EU) 2015/757 for voyages falling within the scope of this Regulation based on the chosen monitoring methodology by the company.

Method for determining WtT GHG emission factors

The WtT emissions are determined on the basis of the methodology contained in this Annex as provided in Equation (1).

The WtT GHG emission factors ($CO_{2eqWtT,j}$) default values are contained in Annex II.

In the case of fossil fuels, only the default values in Annex II shall be used.

Actual values may be used provided that they are certified, under a scheme that is recognised by the Commission in accordance with Article 30(5) and (6) of the Directive (EU) 2018/2001

for biofuels, biogas, renewable fuels of non-biological origin and recycled carbon fuels, in application of Article 9(3).*

***[Technical further adjustment needed, if the compromise on Article 9 is supported]**

For non-fossil fuels, wherever values different from the default values in Annex II are used, these shall be based on relevant Bunker Delivery Notes (BDNs), for the fuels delivered to the ship in the reference period, for at least equal quantities of fuels as the one determined as being consumed in scope of the regulated journey in accordance with point A.

The WtT GHG ($CO_{2eqWtT,t}$) of the fuels (which are not fossil fuels) are established in Directive (EU) 2018/2001. The actual values, contained in the Directive that shall be used for the purpose of this Regulation, in accordance with the methodology, are those without combustion¹⁵. For those fuels for which pathways are not included in the Directive and for fossil fuels, the WtT GHG emission factors ($CO_{2eqWtT,t}$) default values are contained in Annex II.

Fuel Bunker Delivery Note (BDN)

Under existing MARPOL Annex VI regulations, the BDN is mandatory and information to be included in the bunker delivery note is specified.

For the purposes of this regulation:

1) BDNs including fuels other than fossil fuels used on board shall be complemented with the following information regarding those fuels:

- **Lower Calorific Value [MJ/g].**
- **For biofuels, E values as established in accordance with the methodologies laid down in Directive (EU) 2018/2001, Part C of Annex V and Part B of Annex VI [gCO₂eq/MJ] and related evidence of compliance with the rules set out in that Directive for those fuels, identifying the fuel production pathway,**
- **For fuels other than fossil fuels and biofuels, WtT GHG emission factor CO₂eq [gCO₂eq/gFuelMJ] and related certificate identifying the fuel production pathway,**

2. [In case of product blending, information required by this regulation shall be given for each product].

BDN Electricity Delivery Note (EDN)

¹⁵ — Reference is made to Directive (EU) 2018/2001, Annex V.C.1.(a) to the term e_u ‘emissions from the fuel in use’

For the purposes of this regulation, relevant EBDNs for electricity delivered to the ship shall contain at least the following information:

1. supplier: name, address, telephone, email, representative
2. receiving ship: IMO number (MMSI), ship name, ship type, flag, ship representative
3. port: name, location (LOCODE), terminal/ berth
4. on-shore power supply connection ~~connection electrical charging~~ point: ~~OPS-SSE connection point~~, connection point details
5. on-shore power supply ~~connection electrical charging~~ time: date/time of commencement/finalisation
6. energy supplied: power fraction allocated to supply point (if applicable) [kW], electricity consumption (kWh) for the billing period, peak power information (if available)
7. metering

Method for determining TtW GHG emission factors

The TtW emissions are determined on the basis of the methodology contained in this Annex as provided in Equation (1) and Equation (2)

The TtW GHG emission factors ($CO_{2eq,TtW,j}$) default values are contained in Annex II.

In accordance with its monitoring plan referred to in Article 7 and upon assessment by the verifier, other methods, such as direct CO_{2eq} measurement, laboratory testing, may be used if it enhances the overall accuracy of the calculation, in application of Article 9(4).

~~For the purpose of this Regulation, the TtW GHG emission factors ($CO_{2eq,TtW,j}$) that shall be used to determine the GHG emissions are contained in Annex II. The CO_2-C_f factors shall be the ones established in Regulation (EU) 2015/757 and are reported in the Table for easy reference. For fuels whose factors are not included in the said regulation, default factors as contained in Annex II shall be used.~~

~~In accordance with its compliance plan referred to in Article 6 7 and upon assessment by the verifier, other methods, such as direct CO_{2eq} measurement, laboratory testing, may be used if it enhances the overall accuracy of the calculation.~~

Method for determining TtW fugitive and slipped emissions

Fugitive and slipped emissions are emissions caused by the amount of fuel that does not reach the combustion chamber of the combustion unit or that is not consumed by the energy converter-fuel consumer unit because they are uncombusted, vented, or leaked from the system. For the purpose of this Regulation, fugitive and slipped emissions are taken into account as a percentage of the mass of the fuel used by the fuel consumer unit engine. The default values are contained in Annex II.

Methods for determining the reward factors linked to wind assisted propulsion ~~substitute sources of energy~~¹⁶

In case wind assisted propulsion ~~is~~ ~~substitute sources of energy~~ are installed on board, a reward factor for ~~substitute sources of energy~~ can be applied, - In case of wind power such reward factor is determined as follow:

Reward factor for wind assisted propulsion - WIND (f_{wind})	$\frac{P_{Wind}}{P_{Prop}}$
0,99	0,051
0,97	0,12
0,95	$\geq 0,153$

Where:

- P_{Wind} is the available effective power of the wind assisted propulsion systems and corresponds to $f_{eff} * P_{eff}$ as calculated in accordance with the *2021 guidelines guidance on treatment of innovative energy efficiency technologies for calculation and verification of the attained EEDI and EEXI* (MEPC.1/Circ.896);
- P_{Prop} is the propulsion power of the ship and corresponds to P_{ME} as defined in the *2018 guidelines on the method of calculation of the attained energy efficiency design index (EEDI) for new ships* (IMO resolution MEPC.308(73), as amended) and the *2021 guidelines on the method of calculation of the attained energy efficiency existing ships index (EEXI)* (IMO resolution MEPC.333(76)). In case where shaft motor(s) are installed, $P_{Prop} = P_{ME} + P_{PTI(i),shaft}$.

The ship GHG intensity index is then calculated by multiplying the result of Equation (1) by the reward factor.

1. Verification and Certification

Fuel Class	WtT	TtW
------------	-----	-----

¹⁶ Included in the package for the wind propulsion

Fossil	Default values shall be used as provided in Table 1 of this Regulation	MRV Regulation CO ₂ carbon factors shall be used for fuels for which such factor is provided For all other emissions factors, default values can be used as provided in Table 1 of this Regulation, alternatively Certified values by mean of laboratory testing or direct emissions measurements
Sustainable Renewable Fuels (Bio Liquids, Bio Gases, e-Fuels)	CO _{2eq} values as provided in RED II (without combustion) can be used for all fuels whose pathways are included in RED II, alternatively RED II approved certification scheme can be used	Emissions factors, default values can be used as provided in Table 1 of this Regulation, alternatively Certified values by mean of laboratory testing or direct emissions measurements.
Others (including electricity)	CO _{2eq} values as provided in RED II (without combustion) can be used for all fuels whose pathways are included in RED II, alternatively RED II approved certification scheme can be used	Emissions factors, default values can be used as provided in Table 1 of this Regulation, alternatively Certified values by mean of laboratory testing or direct emissions measurements.

DEFAULT EMISSION FACTORS

The default emissions factors contained in the table below shall be used for the determination of the greenhouse gas intensity index referred to in Annex I of this Regulation, except when companies divert from these default emissions factors in application of Article 9(3) and (4).

The emissions factors for fossils fuels contained in this Annex shall be used for the determination of the greenhouse gas intensity index referred to in Annex I of this Regulation.

The emissions factors of biofuels, biogas, renewable fuels of non-biological origin and recycled carbon fuels shall be determined according to the methodologies set out in Annex 5 part C of Directive (EU) 2018/2001.

In the table:

- TBM stands for To Be Measured
- N/A stands for Not Available
- The dash means not applicable
- **E is established in accordance with the methodologies laid down in Directive (EU) 2018/2001, Part C of Annex V and Part B of Annex VI**

Where a cell indicates either TBM or N/A, the highest default value of the fuel class in the same column shall be used. Where, for a particular fuel class, all cells in the same column indicate either TBM or N/A, default value of the least favourable fossil fuel pathway shall be used.

			WtT	TtW				
Others	Electricity	-	106,3 EU ENERGY MIX 2020 72 EU ENERGY MIX 2030	On-shore power supply (OPS)	-	-	-	-

Column 1 identifies the class of the fuels namely Fossils, Liquid Biofuels, Gaseous Biofuels, e-Fuels;

Column 2 identifies the name or the pathways of the relevant fuels within the class. For the Liquid Biofuels, Gaseous Biofuels, RFNBO (e-Fuels) the values for the WtT section shall be taken from Directive (EU) 2018/2001 (without combustion¹⁷); for fossils fuels only the default values in the table shall be used.

Column 3 contains the Lower Calorific Value of the fuels expressed in [MJ/g]. **For liquid biofuels, values of Energy content by weight (lower calorific value, MJ/kg) as set out in Annex III of Directive (EU) 2018/2001 shall be converted in MJ/g and used.**

Column 4 contains the WtT GHG emission factors in [gCO_{2eq}/MJ]. For liquid biofuels, the default values shall be calculated by using the values of *E* established in accordance with the methodologies laid down in Directive (EU) 2018/2001, Part C of Annex V for all liquid biofuels except bio-LNG and Part B of Annex VI for bio-LNG, and on the basis of default values associated to the particular biofuel used as a transport fuel and its production pathway, laid down in that Directive, Part D and E of Annex V for all liquid biofuels except bio-LNG and in Part D of Annex VI for bio-LNG. However, the values of *E* need to be adjusted by subtracting the ratio of the values contained in column 6 (cf CO₂) and column 3 (LCV). This is required in this regulation, which separates the WtT and the TtW calculations, to avoid double counting of emissions.

contains the CO_{2eq} emissions values in [gCO_{2eq}/MJ]. For fossils fuels only the default values in the table shall be used. For all other fuels, (except were expressly indicated), values shall be calculated

¹⁷ Reference is made to Directive (EU) 2018/2001, Annex V.C.1.(a) to the term e_a 'emissions from the fuel in use'.

by using the methodology or the default values as per in Directive (EU) 2018/2001 ~~deducted of the combustion emissions considering full oxidation of the fuel~~¹⁸.

For RFNBO, default values are to be calculated by using the methodology of the delegated act taken on basis of Article 28(5) of Directive (EU) 2018/2001¹⁹.

Column 5 identifies the main types/classes of ~~energy converter~~ **fuel consumer units** such as 2 and 4 strokes Internal Combustion Engines (ICE) Diesel or Otto cycle, **Lean-Burn Spark-Ignited (LBSI) engines**, gas turbines, fuels cells, etc.

Column 6 contains the emission factor C_f for CO_2 in $[\text{gCO}_2/\text{gfuel}]$. Emissions factors values as specified in the Regulation (EU) 2015/757 ~~(or IMO MEPC245 (66) as amended)~~ shall be used. For all those fuels not contained in Regulation (EU) 2015/757, the default values ~~contained~~ **are specified** in the ~~Tables~~ should be used. Values certified by a by ~~an accredited~~ **trusted certifier** ~~(under the relevant provisions made in Directive (EU) 2018/2001)~~ can be used in place of the default values.

Column 7 contains the emission factor C_f for methane in $[\text{gCH}_4/\text{gfuel}]$. ~~Default values as contained in the table shall be used. Values certified by an accredited certifier mean of testing can be used in place of the default values.~~ For LNG fuels, C_f for methane are set to zero.

Column 8 contains the emission factor C_f for nitrous oxide in $[\text{gN}_2\text{O}/\text{gfuel}]$. ~~Default values as contained in the table shall be used. Values certified by an accredited certifier mean of testing can be used in place of the default values.~~

Column 9 identifies the part of fuel lost as fugitive **and slipped** emissions (C_{slip}) measured ~~d~~ as % of mass of fuel used by the specific ~~energy converter~~ **fuel consumer unit**. ~~Default values as contained in the table shall be used. Values certified by an accredited certifier mean of testing can be used in place of the default values.~~ For fuels such as LNG for which the fugitive **and slipped** emissions ~~(slip)~~ exists, the amount of fugitive **and slipped** emissions as presented in ~~the~~ Table 4 is expressed in % of the mass of fuel used (Column 9). ~~The values contained in Column 9 shall be used, in accordance with equation (1).~~ The values of C_{slip} in ~~the~~ Table (4) are calculated at 50% of the **full** engine load.

¹⁸ Reference is made to Directive (EU) 2018/2001, Annex V.C.1.(a) to the term e_u 'emissions from the fuel in use'²

¹⁹ **Or on basis of the corresponding provisions in the amended Directive, according to the progress of the co-legislators.**

**CRITERIA FOR THE USE OF ZERO-EMISSION TECHNOLOGY AS
REFERRED TO IN ARTICLES 5(3)(b) and 7(3), points (d) and (f)**

The following table provides a list of zero-emission technologies as referred to in Article 5(3)(b), as well as, specific criteria for their use as applicable.

Zero-emission technology	Criteria for use
Fuel cells	Fuel cells used on board for power generation while at berth should be fully powered by renewable and low carbon fuels.
On-board Electricity Storage	The use of on-board electricity storage is allowed irrespective on the source of energy that produced the stored power (on-board generation or on-shore in case of battery swapping).
On-board Electricity production from wind and solar energy	Any ship that is capable to sustain energy electricity production needs power demand at berth through the use of wind and solar energy.

The use of these zero-emission technologies shall continuously achieve emissions that are equivalent to the emissions reductions that would be achieved by using on-shore power supply.

GENERAL REQUIREMENTS FOR ZERO-EMISSION TECHNOLOGIES

The following non-exhaustive table identifies types of technologies as well as general requirements for their operation to be considered as zero-emission technologies within the meaning of Article 3(g).

Types of technology	General requirements for operation
Fuel cells	Power supplied by on-board fuel cells with a fuel or a system ensuring that, when used to provide energy, it does not release any emissions mentioned in point g of Article 3 any greenhouse gases or air pollutants into the atmosphere.
On-board Electrical Energy Storage	Power supplied by on-board electrical energy storage systems previously charged via: <ul style="list-style-type: none"> - onboard power generation at sea - on-shore power or shore side battery charging - battery swapping
On-board power generation from wind and solar energy	Power supplied by on-board renewable energy sources, either directly supplying to the ship grid or via charging of on-board intermediate Electrical Energy Storage.

Power supplied by on board technologies not identified above that achieve zero emission, in the meaning of Article 3(g), can be added to this table by way of delegated acts in accordance with Article 5(4).

The fulfilling of the general requirements indicated above and in Article 5(4) for other technologies as well as of the detailed criteria for acceptance specified in the implementing acts adopted in accordance with Article 5(4) of this Regulation must be proved by relevant documentation.²⁰

²⁰ EP wants to reintroduce Annex III and a delegated act.

**~~CERTIFICATE TO BE ISSUED BY THE MANAGING BODY OF THE PORT OF CALL IN
CASES WHERE SHIPS CANNOT MAKE USE OF OPS FOR JUSTIFIED REASONS (ARTICLE
5(5))—MINIMUM ELEMENTS TO BE INCLUDED IN THE CERTIFICATE~~**

~~For the purposes of this Regulation, the certificate referred to in Article 5(5) shall contain at least the following information:~~

- ~~(1) Ship identification~~
 - ~~(a) IMO number~~
 - ~~(b) Ship name~~
 - ~~(c) Call sign~~
 - ~~(d) Ship type~~
 - ~~(e) Flag~~
- ~~(2) Port of call~~
- ~~(3) Location/terminal name~~
- ~~(4) Arrival date and time (ATA)~~
- ~~(5) Departure date and time (ATD)~~

~~The confirmation from the managing body of the port that the ship was found among any of the following cases:~~

- ~~— the ship made an unscheduled port call for reasons of safety or saving life at sea (Article 5(2-3), point (e))~~
- ~~— the ship was unable to connect to on-shore power supply due to unavailable connection points in the port (Article 5(2-3), point (d))~~
- ~~— the on-shore power supply equipment on board was found to be incompatible with the shore installation at the port (Article 5(2-3), point (e))~~
- ~~— that the ship used, for a limited period of time on board energy generation, under emergency situations representing immediate risk to life, the ship, or the environment (Article 5(2-3), point (f)).~~
- ~~(6) Details of the managing body of the port~~
 - ~~(a) Name~~
 - ~~(b) contact (phone, email)~~
- ~~(7) Date of issue~~

FORMULAS FOR CALCULATING THE COMPLIANCE BALANCE AND **REMEDIAL PENALTY LAID DOWN IN ARTICLE 20(1bis)**

A. FORMULA FOR CALCULATING THE SHIP'S COMPLIANCE BALANCE

For the purpose of calculating the compliance balance of a ship the following formula shall apply:

Compliance balance $[gCO_{2eq}/MJ] =$	$(GHGIE_{target} - GHGIE_{actual}) \times [\sum_i^{n_{fuel}} M_i \times LCV_i + \sum_i^l E_i]$
---------------------------------------	--

Where:

gCO_{2eq}	Grams of CO ₂ equivalent
$GHGIE_{target}$	Greenhouse gas intensity limit of the energy used on-board a ship according to Article 4(2) of this Regulation
$GHGIE_{actual}$	Yearly average of the greenhouse gas intensity of the energy used on-board a ship calculated for the relevant reporting period

For any ship having the ice-class IC, IB, IA or IA Super or an equivalent ice class, the company may request, until 31 December 2034, to exclude the additional energy consumption, due to sailing in ice conditions.

For any ship having the ~~and/or due to ice-class~~ IA or IA Super or an equivalent ice class, the company may request to exclude the additional energy consumption, due to the technical characteristics of the ship.

For both cases, the calculation of the compliance balance above, the values of M_i shall be replaced by the adjusted mass of fuel M_{iA} defined in Annex IV and the value of $GHGIE_{actual}$ to be used for calculating the compliance balance shall be recalculated with the corresponding values of M_{iA} .

B. FORMULA FOR CALCULATING THE REMEDIAL PENALTY LAID DOWN IN ARTICLE 20(1BIS)

The amount of the **remedial** penalty laid down in Article 20(1bis) shall be calculated as follows:

Remedial Penalty =	$\frac{ (\text{Compliance balance}) }{GHGIE_{\text{actual}} \times 41000} \times 2400$
-------------------------------	--

1. Remedial Penalty	2. Is in EUR
3. <u>abs(Compliance balance)</u>	4. <u>Is the absolute value of the compliance balance</u>
5. <u>41000</u>	6. <u>Is 1 metric ton of VLSFO that is equivalent to 41000 MJ</u>
7. <u>2400</u>	8. <u>Is the amount to be paid in EUR per equivalent metric ton of VLSFO</u>

CALCULATION OF ADJUSTED MASS OF FUEL FOR ICE NAVIGATION

This Annex describes how to calculate:

- the additional energy due to technical characteristics of a ship having the ice class IA or IA Super or an equivalent ice class
- the additional energy used by a ship having the ice class IC, IB, IA or IA Super or an equivalent ice class due to sailing in ice conditions
- the adjusted mass $[M_i A]$ after the deduction of the additional energy, allocated to each fuel i

Additional energy due to ice class

The additional energy consumption due to the technical characteristics of a ship having the ice class IA or IA Super or an equivalent ice class is calculated as follows :

$$E_{\text{additional due to ice class}} = 0.05 \times (E_{\text{voyages, total}} - E_{\text{additional due to ice conditions}})$$

where $E_{\text{voyages, total}}$ denotes the total energy consumed for all voyages and $E_{\text{additional due to ice conditions}}$ additional energy consumption due to sailing in ice conditions.

The total energy consumed for all voyages is calculated using :

$$E_{\text{voyages, total}} = \sum M_{i, \text{voyages, total}} \times LCV_i$$

where $M_{i, \text{voyages, total}}$ denotes the mass of fuel i consumed for all voyages within the scope of the regulation, LCV_i the lower calorific value of fuel i .

Additional energy due to sailing in ice conditions

The additional energy consumption due to sailing in ice conditions is calculated as follows :

$$E_{\text{additional due to ice conditions}} = E_{\text{voyages, total}} - E_{\text{voyages, open water}} - E_{\text{voyages, ice conditions, adjusted}}$$

where $E_{\text{voyages, open water}}$ denotes the energy consumed on voyages in open water and $E_{\text{voyages, ice conditions, adjusted}}$ the adjusted energy consumed in ice conditions.

$E_{\text{additional due to ice conditions}}$ cannot be higher than $1,3^* E_{\text{voyages, open water}}$

The energy consumed for voyages that include sailing in open water only is calculates as follows:

$$E_{\text{voyages, open water}} = E_{\text{voyages, total}} - E_{\text{voyages, ice conditions}}$$

where $E_{voyages, ice conditions}$ denotes energy consumed for sailing in ice conditions, which is calculated as follows :

$$E_{voyages, ice conditions} = \sum M_i \text{voyages, ice conditions} \times LCV_i$$

where M_i , voyages, ice conditions denotes the mass of fuel i consumed for sailing in ice conditions, within the scope of the Regulation.

The adjusted energy consumed in ice conditions is calculated as follows:

$$E_{voyages, ice conditions, adjusted} = D_{ice conditions} \times (E/D)_{open water}$$

Where:

$D_{ice conditions}$ denotes the aggregated distance travelled when sailing in ice conditions within the scope of the regulation.

$(E/D)_{open water}$ is the energy consumption per distance travelled in open water calculated as follows:

$$(E/D)_{open water} = (E_{voyages, total} - E_{voyages, ice conditions}) / (D_{total} - D_{ice conditions})$$

Where:

$E_{voyages, ice conditions}$ denotes the energy consumption when sailing in ice conditions and D_{total} is the aggregated annual distance travelled within the scope of the regulation.

Total additional ice energy due to ice class and sailing in ice conditions

$$E_{\text{additional ice}} = E_{\text{additional due to ice class}} + E_{\text{additional due to ice conditions}}$$

Adjusted mass [M_{iA}]

The company shall allocate the total additional ice energy $E_{\text{additional ice}}$ to the different fuels i used during the year, with the following conditions:

$$\sum E_{\text{additional ice}} = E_{\text{additional ice}}$$

$$\text{For each fuel } i, E_{\text{additional ice}} \leq M_i \times LCV_i$$

The [M_{iA}] adjusted mass of fuel is calculated as follows :

$$M_{iA} = M_i - E_{\text{additional ice}} / LCV_i$$

ADDENDUM 1

All drafting suggestions are, at this stage, preliminary and without prejudice to further legal review

Article 4 a *Use of Renewable Fuels of Non-Biological Origin*

- 1. As provided for in Annex I for the calculation of the greenhouse gas intensity of the energy used on-board by a ship, from 1 January 2025 to 31 December 2034, a multiplier of “2” can be used to reward the ship for the use of renewable fuels of non -biological origin.**
- 2. The Commission shall monitor, calculate and publish annually, on the basis of the data recorded in the FuelEU Database and at the latest 18 months after the end of each reporting period, the share of renewable fuels of non-biological origin in the yearly energy used on-board by ships covered by this Regulation.**
- 3. If the share of renewable fuels of non-biological origin referred to in paragraph 2 for reporting period [2031] is less than 1%, a subtarget of at least 2% for such fuels in the yearly energy used on-board by a ship shall apply from 1 January 2035, subject to paragraph 5.**
- 4. Paragraph 3 shall not apply, where the monitoring results provided for in paragraph 2, available before 1 January 2034, demonstrate that the share referred to in paragraph 2 is more than 2%.**
- 5. If, based on the monitoring activities referred to in paragraph 2 and following the Commission assessment, there is evidence of insufficient production capacity and availability to the maritime sector, uneven geographical distribution or a too high price of renewable fuels of non-biological origin, the subtarget provided for in paragraph 3 shall not apply.**
- 6. The Commission shall adopt implementing acts, in accordance with examination procedure referred to in Article 27(3) to establish the criteria for the assessment provided for in paragraph 5.**
- 7. The Commission is empowered to adopt delegated acts in accordance with Article 26 to:**
 - supplement elements referred to in paragraph 5;**
 - inform the companies about the non applicability of the subtarget referred to in paragraph 3, resulting from the monitoring or assessment in paragraphs 2 or 5, respectively.**

8. Where the subtarget referred to in paragraph 3 applies, the Commission shall adopt, by 31 December [2034], implementing acts in accordance with the examination procedure referred to in Article 27(3) to further specify the rules for the application of paragraph 3 as regards:

- a) verification and calculation as defined in Article 15;
- b) applicable flexibility mechanisms as defined in Articles 17 and 18;
- c) applicable penalties as defined in Article 20 and [Annex IV].

9. The subtarget established in paragraph 3, if relevant, shall not apply to a ship, which demonstrates* that the same share of the yearly energy used on-board is met by fuels providing equivalent greenhouse gas savings and are certified pursuant to the provisions of Article 9.

10. This Article shall not apply to the share of yearly energy used on-board by ships derived from onshore power supply.

*This should be possibly reflected somehow in governance provisions; drafting suggestions not ready yet

Other changes can be considered in the governance, banking and borrowing provisions as follows (these examples might not be exhaustive):

Article 15
Verification and calculation

[...]

2. On the basis of the compliant FuelEU report, the verifier shall:

[...]

(d) calculate the amount of the yearly energy used on-board by a ship, excluding energy derived from onshore power supply;

(e) calculate the amount of the yearly energy used on-board by a ship derived from the renewable fuels of non-biological origin.

Article 17
Banking and borrowing of compliance surplus between reporting periods

1. Based on the information referred to in Article 15(2), where the ship has a compliance surplus for the reporting period **a compliance surplus on its greenhouse gas intensity as referred to in**

Article 4(2) or, if applicable, on the subtarget for fuels of non-biological origin as referred to in Article 4a(3), the company may bank it to the same ship's compliance balance for the following reporting period. The company shall record the banking of the compliance surplus to the following reporting period in the FuelEU database subject to approval by its verifier. The company may no longer bank the compliance surplus once the FuelEU document of compliance has been issued.

Article 18
Pooling of compliance

The compliance balances **for greenhouse gas intensity as referred to in Article 4(2) and, if applicable, the subtarget for fuels of non-biological origin referred to in Article 4a(3)** of two or more ships, as calculated in application of Article 15(2), may be pooled for the purposes of fulfilling the requirements of Article 4 and **Article 4a(3)**. ~~A ship's compliance balance may not be included in more than one pool in the same reporting period.~~ **Two separate pools can be used for greenhouse gas intensity target and for the subtarget for fuels of non-biological origin. However, for either targets, a ship's compliance balance may not be included in more than one pool in the same reporting period.**

As regards the impact that the new system would have on the provisions relating to the remedial penalties, drafting suggestions are not ready yet. Nevertheless, the Presidency is of the idea that the Regulation should include frame provisions in this respect (e.g. criterion of proportionality and some basic indications in the formula), while details could be further specified by implementing acts.
