Presidency compromise text	Drafting Suggestions Comments
<p>2023/0077 (COD)</p> <p>Proposal for a</p> <p>REGULATION OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL</p>	<p>ES:</p> <p>(Comments):</p> <p>The comments and written suggestions by Spain reflected in this document are referred to the amendments included in REV2 by the Presidency: art 9, art. 19a and art. 19b.</p> <p>However, on the other elements of this draft regulation Spain maintains the position reflected in the written comments already circulated. In addition, the comments and suggestions in this document are without prejudice of further ones that might be considered in view of the evolution of negotiations.</p> <p>BE:</p> <p>(Comments):</p> <p>General Comment</p> <p>We are still analysing the different elements but our first and preliminary conclusions are</p> <p>1. We welcome and support in principle the proposal by the commission and in particular the underlying objectives</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<ul style="list-style-type: none">• To accelerate energy investments which ensure flexibility, capacity, and Security of Supply. This flexibility will contribute to the integration of renewable energy.• To increase liquidity in the long term markets and to strengthen the opportunities for energy market participants to engage and hedge in the longer run (e.g. the different proposals on development of long term products and contracts, coupling of forward market over bidding zones, ..)• To allow all European consumers to benefit from affordable and competitive electricity prices and bills• The framework for consumers to have the choice between affordable, stable and predictable prices and more dynamic prices that give the possibility for demand-side management.• However, we wonder how the interaction between all the old and new instruments (PPAs, CfDs, forward markets, flexibility schemes, auctions, zero-bid) will be managed and coordinated to work together cost-efficiently as supply of and demand for these products overlaps and the design may differ between Member States. <p>2. Belgium is already implementing several elements of the proposed market principles such as suppliers of last resort, two-sided CfDs and PPA's for some RES installations, protection measures for vulnerable consumers, energy sharing, etc. and wishes to strengthen them further.</p> <p>3. Moreover, Belgium welcomes the recommendations on energy storage, and highlights it already applies them via different policy initiative It is important these national ongoing initiatives should not be delayed through this process, but on the contrary should benefit from some form of flexibility for early adopters.</p> <p>4. We understand the need for speedy implementation of the proposals and stand ready to constructively cooperate with the Presidency to work on a swift adoption. However, where important transpositions are required, we should also allow MS for the necessary time to do so in qualitative way. There are many points that need to be clarified. We also underline the need to ensure consistency between the different new and existing texts, particularly in terms of concepts, vocabulary, and the continued implementation of the texts from 2019.</p>

	<p>5. Although we see the merits of the current proposals, we propose nevertheless to analyse whether adjustments and prolongation of some emergency measures that have been deployed in 2022 are needed in order to ensure security of supply and can give shelter to European citizens, undertakings, and public authorities from extreme prices.</p> <p>6. Even though we understand the need to act swiftly and the fact that a deep reform of the electricity market is unachievable under such short timing. We encourage the Commission to make an assessment of alternative market systems for (short-term) markets, in which both advantages and drawbacks are properly analysed, to avoid alternative systems distorting price signals, thereby endangering the benefits achieved up until now and possibly increasing the overall cost of the energy transition.</p> <p>Next to this general first conclusions, Belgium wants to express a general security reservation as it is still analysing the proposal.</p> <p>To conclude we have a general question on how the interaction between all the old and new instruments (PPAs, CfDs, forward markets, flexibility schemes) will be managed and coordinated to work together cost-efficiently as supply of and demand for these products overlaps and the design may differ between Member States</p>
amending Regulations (EU) 2019/943 and (EU) 2019/942 as well as Directives (EU) 2018/2001 and (EU) 2019/944 to improve the Union's electricity market design	

Electricity market design (ST 8918/23) // Presidency compromise text REV 2Deadline: **12 May 2023**

THE EUROPEAN PARLIAMENT AND THE COUNCIL OF THE EUROPEAN UNION,	
Having regard to the Treaty on the Functioning of the European Union, and in particular Article 194(2) thereof,	
Having regard to the proposal from the European Commission,	
After transmission of the draft legislative act to the national parliaments,	
Having regard to the opinion of the European Economic and Social Committee,	
Having regard to the opinion of the Committee	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

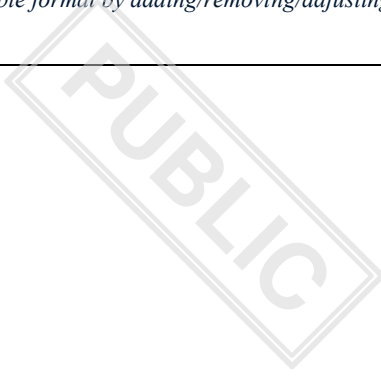

of the Regions,	
Acting in accordance with the ordinary legislative procedure,	
Whereas:	
(1) Very high prices and volatility in electricity markets have been observed since September 2021. As set out by the European Agency for the Cooperation of Energy Regulators ('ACER') in its April 2022 assessment of EU wholesale electricity market design ¹ , this is mainly a consequence of the high price of gas, which is used as an input to generate electricity.	

¹ European Union Agency for the Cooperation of Energy Regulators, ACER's Final Assessment of the EU Wholesale Electricity Market Design, April 2022.

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>(2) The escalation of the Russian military aggression against Ukraine, a Contracting Party of the Energy Community, and related international sanctions since February 2022 have disrupted global energy markets, exacerbated the problem of high gas prices, and have had significant knock-on impacts on electricity prices. The Russian invasion of Ukraine has also caused uncertainty on the supply of other commodities, such as hard coal and crude oil, used by power-generating installations. This has resulted in substantial additional increases in the volatility of price levels of electricity.</p>	
<p>(3) In response to this situation, the Communication on Energy Prices presented by the Commission in October 2021 contained a toolbox of measures that the EU and its Member States may use to address the immediate impact of high energy prices on households and businesses (including income support, tax</p>

<p>breaks, gas savings and storage measures) and to strengthen resilience against future price shocks. In its Communication of 8 March 2022 entitled ‘REPowerEU: Joint European Action for more affordable, secure and sustainable energy’² the Commission outlined a series of additional measures to strengthen the toolbox and to respond to rising energy prices. On 23 March 2022, the Commission also established a temporary State Aid regime to allow certain subsidies to soften the impact of high energy prices.³</p>	
<p>(4) On 18 May 2022 the Commission presented the REPowerEU plan⁴ that introduced additional measures focusing on energy savings,</p>

<p>innovative products, services and measures on retail electricity markets, supporting energy efficiency and renewable energy uptake and enhancing choice so as to help consumers reduce their energy bills also through small-scale generation installations and emerging services for providing demand response. Building on and seizing the potential of the digitalisation of the energy system, such as active participation by consumers, should be a key element of our future electricity markets and systems. At the same time, there is a need to respect consumer choices and allow consumers to benefit from a variety of contract offers.</p>	
<p>(8) In the context of the energy crisis, the current electricity market design has however also revealed a number of important shortcomings linked to the impact of high and volatile fossil fuel prices on short-term electricity markets, which expose households and companies to significant price spikes with</p>	<p>BE:</p> <p>(Drafting):</p> <p>In the context of the energy crisis, the current electricity market design has however also revealed a number of important shortcomings and unexpected consequences linked to the impact of high and volatile fossil fuel prices on short-term electricity markets, which expose</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

effects on their electricity bills.	households and companies to significant price spikes with effects on their electricity bills.
(9) A faster deployment of renewable energy and clean flexible technologies constitutes the most sustainable and cost-effective way of structurally reducing the demand for fossil fuels for electricity generation and for direct consumption through electrification and energy system integration. Thanks to their low operational costs, renewable sources can positively impact electricity prices across the Union and reduce direct consumption of fossil fuels.	
(10) The changes to the electricity market design should ensure that the benefits from rising renewable power deployment, and the energy transition as a whole, are brought to consumers, including the most vulnerable ones, and ultimately, shield them from energy crises	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

and avoid more households falling into energy poverty trap. These should mitigate the impact of high fossil fuel prices, notably that of gas, on electricity prices, aiming to allow households and companies to reap the benefits of affordable and secure energy from sustainable renewable and low carbon sources in the longer term.	
(11) The reform of the electricity market design should benefit not just household consumers but also the competitiveness of the Union's industries by facilitating their possibilities to make the clean tech investments they require to meet their net zero transition paths. The energy transition in the Union needs to be supported by a strong clean technology manufacturing basis. These reforms will support the affordable electrification of industry and the Union's position as a global leader in terms of research and innovation in clean energy technologies.	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

(12) Well-functioning and efficient short-term markets are a key tool for the integration of renewable energy and flexibility sources in the market and facilitate energy system integration in a cost-effective manner.	
(13) Intraday markets are particularly important for the integration of variable renewable energy sources in the electricity system at the least cost as they give the possibility to market participants to trade shortages or surplus of electricity closer to the time of delivery. Since variable renewable energy generators are only able to accurately estimate their production close to the delivery time, it is crucial for them to have a maximum of trading opportunities via access to a liquid market as close as possible to the time of delivery of the electricity.	
(14) It is therefore important for the intraday markets to adapt to the participation of variable	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

renewable energy technologies such as solar and wind as well as to the participation of demand side response and energy storage. The liquidity of the intraday markets should be improved with the sharing of the order books between market operators within a bidding zone, also when the cross-zonal capacities are set to zero or after the gate closure time of the intraday market. Furthermore, the gate closure time of the intraday market should be set closer to the time of delivery to maximize the opportunities for market participants to trade shortages and surplus of electricity and contribute to better integrating variable renewables in the electricity system.	
(15) In addition, the short-term electricity markets should ensure that small-scale flexibility service providers can participate by lowering the minimum bid size.	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>(16) To ensure the efficient integration of electricity generated from variable renewable energy sources and to reduce the need for fossil-fuel based electricity generation in times when there is high demand for electricity combined with low levels of electricity generation from variable renewable energy sources, it should be possible for transmission system operators to design a peak shaving product enabling demand response to contribute to decreasing peaks of consumption in the electricity system at specific hours of the day. In addition, the peak shaving product should contribute to ensuring security of supply. The peak shaving product should contribute to maximize the integration of electricity produced from renewable sources into the system by shifting the electricity consumption to moments of the day with higher renewable electricity generation. As the peak shaving product aims to reduce and shift the electricity consumption, the scope of this product should be limited to demand-side</p>	<p>BE:</p> <p>(Drafting):</p> <p>[...]</p> <p>The peak shaving product should contribute to maximize the integration of electricity produced from renewable sources into the system by shifting the electricity consumption to moments of the day with higher supply marginwith higher renewable electricity generation. <p>response. The procurement of the peak shaving product should take place on a short notice so as to avoid booking demand response capacities that could otherwise participate in wholesale electricity markets in normal conditions. Its activation should be limited in time to limit distortive effects on the electricity market. The procurement of the peak shaving product should in particular avoid any impact on the day-ahead price, and its activation should in such a way that it does not overlap with the activation of balancing products which aim at maintaining the frequency of the electricity system stable. In order to verify volumes of activated demand reduction, the transmission system operator should use a baseline reflecting the expected electricity consumption without the activation of the peak shaving product.</p>	<p>of this product should be limited to demand-side response. The procurement of the peak shaving product should take place on a short notice so as to avoid booking demand response capacities that could otherwise participate in wholesale electricity markets in normal conditions. Its activation should be limited in time to limit distortive effects on the electricity market. The procurement of the peak shaving product should in particular avoid any impact on the day-ahead price, and its activation should in such a way that it does not overlap with the activation of balancing products which aim at maintaining the frequency of the electricity system stable. In order to verify volumes of activated demand reduction, the transmission system operator should use a baseline reflecting the expected electricity consumption without the activation of the peak shaving product.</p> <p>IE:</p> <p>(Comments):</p> <p>Price Review 5 Decision published by the Irish utility Regulatory Authority (CRU20154)). This Directive requires Member States to provide the necessary regulatory framework to allow and provide incentives to distribution system operators to procure flexibility services, including congestion management in their areas, in order to improve efficiencies in the operation and development of the distribution system. Peak shaving products are already a key part of implementing congestion management and the associated products.</p> <p>ACER-CEER position is that peak-shaving products should not occur for the following</p>
---	--

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>reasons - Peak shaving is not needed, because: 1. It does not provide much investment incentive in demand response – there is already a dedicated article for promoting investments in demand response Article 19e and 19f. 2. Peak shaving cannot be labelled as non-frequency ancillary service because the operational security of the system is not endangered without this peak shaving. 3. This article introduces a significant risk of market manipulation by TSOs, which by default should not impact market prices. 4. This article does not reduce electricity prices for most consumers in case of scarcity, because it reduces demand after the day ahead market.</p> <p>IE position is more balanced; we agree with some of the points above, but there may be uses for such a product for short term adequacy challenges (where a CRM response might be OTT), or to manage carbon intensity more actively, for example, a small increase in generation output might not be costly from an energy market perspective but quite emission intensive. Thus, we support the peak-shaving product, as an option for MS.</p>
<p>(17) In order to be able to actively participate in the electricity markets and to provide their flexibility, consumers are progressively equipped with smart metering systems. However, in a number of Member States the roll-out of smart metering systems is still slow. <p>smart metering systems do not provide for the sufficient level of data granularity, transmission and distribution system operators should be able to use data from dedicated measurementmetering devices for the observability and settlement of flexibility services such as demand response and energy storage. Enabling the use of data from dedicated measurementmetering devices for observability and settlement should facilitate the active participation of the consumers in the market and the development of their demand response. The use of data from these dedicated measurementmetering devices should be accompanied by quality requirements relating to the data.</p>	<p>smart metering systems do not provide for the sufficient level of data granularity, necessary for the development of advanced services to consumers, transmission and distribution system operators should be able to allow the use of data from dedicated measurement and use the data of these devices for the observability and settlement, where deemed appropriate, of flexibility these services such as demand response and energy storage. Enabling the use of data from dedicated measurementmetering devices for observability and settlement should facilitate the active participation of the consumers in the market and the development of their demand response. The use of data from these dedicated measurementmetering devices should be accompanied by quality requirements relating to the data.</p> <p>IT:</p> <p>(Comments):</p> <p>The amendment supports amendments to Article 7b, which seek to clarify the purpose and application of dedicated measurement devices, which should be considered separate from “fully fledged” meters which are used for metering and billing a single connection point (i.e. those relevant for the purposes of Article 4 in the Electricity Directive). In particular, it’s essential that TSOs/DSOs are given the right and not the obligation to use such data, while taking into account instances where the roll-out of smart metering systems is still slow. The amendment also adds the right for consumers (or a third party) to use such devices in the absence of a smart metering system, for the purposes of participating in a range of advanced services (such as demand response).</p> <p>IE:</p>

system and enable final customers to value their flexibility solutions.	
(23) Offshore renewable energy sources, such as offshore wind, ocean energy and floating photovoltaic, will play an instrumental role in building a power system largely based on renewables and in ensuring climate neutrality by 2050. There are, however, substantial obstacles to their wider and efficient deployment preventing the massive scale up needed to achieve those objectives. Similar obstacles could arise for other offshore technologies in the future. These obstacles include investment risks associated with the unique topographical situation of offshore hybrid projects connected to more than one market. In order to reduce investment risk for these offshore project developers and to ensure that the projects in an offshore bidding zone have full market access to the surrounding markets, transmission system operators should guarantee access of the

We are not sure that the highlighted text is needed as this should be a role of traditional market participants and aggregators provided on a commercial basis. What could be the value added of the state authorities interference? We are afraid that it might pose further market distortion. Unless well clarified, we would prefer erasing this new addition or amending the wording in order to allow for the market actors to act without direct involvement of the MS.

IE:

(Drafting):

“Without prejudice to that obligation to report on the regulatory context affecting the PPA market, Member States ~~should ensure that~~ could offer instruments to reduce the financial risks associated to the buyer defaulting on its long-term payment obligations in the framework of PPAs are accessible to companies that face entry barriers to the PPA market. Member States could decide to set up a guarantee scheme at market prices, if private guarantees are not accessible or insufficiently accessible. In that case, Member States should include provisions to avoid lowering the liquidity in the electricity markets, such as by using financial PPAs. Member States could decide to facilitate the aggregation of demand for PPAs from customers that individually face barriers to entry to the PPA market, but collectively may provide an attractive offer for PPAs to producers, subject to compliance with appropriate MS regulations. Member States should not provide support to PPAs that purchase generation from fossil fuels. While the default approach should be non-discrimination between consumers..”

publicly financed new investments **by** (“direct price support schemes”) in low carbon, non-fossil fuel electricity generation to achieve the Union’s decarbonisation objectives, those schemes should be structured by way of two-way contracts for difference such as to include, in addition to a revenue guarantee, an upward limitation of the market revenues of the generation assets concerned. **To protect investment certainty, this obligation should apply to contracts under direct price support schemes for new investments in generation concluded as of one year after entry into force of this Regulation.** New investments for the generation of electricity should include investments in new power generating facilities, ~~investments aimed at repowering existing power generating facilities,~~ **and** investments aimed at **substantially repowering** ~~extending~~ existing power generating facilities, **increasing their capacity** or ~~at~~ prolonging their lifetime.

(Drafting):

(30) Where Member States decide to support publicly financed new investments **by** (“direct price support schemes”) in low carbon, non-fossil fuel electricity generation to achieve the Union’s decarbonisation objectives, those schemes should be structured by way of two-way contracts for difference such as to include, in addition to a revenue guarantee, an upward limitation of the market revenues of the generation assets concerned. **To protect investment certainty, this obligation should apply to contracts under direct price support schemes for new investments in generation concluded as of one year after entry into force of this Regulation.** New investments for the generation of electricity should include investments in new power generating facilities, ~~investments aimed at repowering existing power generating facilities,~~ **and** investments aimed at **substantially repowering** ~~extending~~ existing power generating facilities, **increasing their capacity** or ~~at~~ prolonging their lifetime. **Nevertheless, Member States that have a level of interconnectivity far below the interconnection targets for 2020 as referred in point (d)(1) of Article 4 of Regulation (EU) 2018/1999 may establish also a two-way contract for difference at a regulated strike price for existing non-contestable technologies. Indeed, some technologies are non-contestable in several Member States and, in such cases, existing generators are in a position to obtain supra-competitive profits, as rents cannot be competed away by new entry. In such cases, the European legal framework should allow Member States to sign two-way contracts for differences with those generators at a regulated strike price.**

	<p>flexibility resources such as demand-side response and energy storage which should also be reflected in their integrated national energy and climate plans.</p> <p>DK:</p> <p>(Comments):</p> <p>It is of key importance to Denmark that Member States should be able to appoint another competent entity than the regulatory authority to carry out the assessment of flexibility needs. This could be either another competent authority or – as we understand is the suggestion from some Member States – the TSO.</p> <p>The report on the assessment of flexibility needs is a report regarding the design of Member States energy systems with a focus on security of supply, decarbonisation and sector integration. Thus, it regards key issues of political character, which in Denmark are dealt with by the ministry or by an authority accountable to the minister, and thus ultimately under parliamentary control.</p> <p>Also, the task at hand is not a task which forms a natural part of the key tasks of a regulatory authority and which the regulatory authority do not have the relevant expertise for carrying out and thus would be equipped for. Even if the regulatory authority could use consultants it would still need to have the relevant expertise to oversee and assess the consultants' work and take the final responsibility for the report.</p>
--	--

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>In Denmark, the expertise lies with political accountable authorities, which is not the regulatory authority as proposed here.</p> <p>Finally, giving the regulatory authority the responsibility for the assessment would also mean an unnecessary duplication of tasks and inefficient use of resources.</p>
<p>(38) To achieve the national objective for non-fossil flexibility such as demand side response and energy storage investment needs, Member States can design or redesign capacity mechanisms in order to create a green and flexible capacity mechanism. Member States that apply a capacity mechanism in line with the existing rules should promote the participation of non-fossil flexibility such as demand side response and energy storage by introducing additional criteria or features in the design.</p>	<p>IE:</p> <p>(Drafting):</p> <p>To aid the achievement of the national objective for non-fossil flexibility such as demand side response and storage investment needs, Member States can design or redesign capacity mechanisms in order to create a green and flexible capacity mechanism. Member States that apply a capacity mechanism in line with the existing rules should promote the participation of non-fossil flexibility such as demand side response and energy storage in Capacity Mechanisms by introducing additional criteria or features in the design. At the same time, capacity mechanisms retain the purpose of ensuring long-term adequacy and incentives to invest in all kinds of resources, ensuring technology neutrality. Additional solutions may also be applied to stimulate non-fossil flexibility.</p> <p>IE:</p> <p>(Comments):</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>The primary purpose of Capacity Mechanisms is to ensure adequacy, and depending on the needs of a given electricity system, it can be best achieved by adding different kinds of resources – both stable, non-flexible and flexible kinds. Flexibility must not be mistaken with adequacy, and long-term adequacy will not be achieved by flexibility alone: there is a fundamental difference between the short term unavailability of power in a given location of the grid and prolonged lack of capacity to cover demand in the whole system.</p>
<p>(39) To support environmental protection objectives the CO2 emissions' limit, set out in Article 22(4) of Regulation (EU) 2019/943 of the European Parliament and of the Council, should be seen as an upper limit. 	<p>IE:</p> <p>(Comments):</p> <p>Rewording is needed to have consistency with the position we express with respect to Art. 19e(2)</p>
<p>(41) The connection of new generation and demand installations, in particular renewable energy plants, often faces delays in grid connection procedures. One of the reasons for such delays is the lack of available grid capacity at the location chosen by the investor, which implies the need for grid extensions or reinforcements to connect the installations to the system in a safe manner. A new requirement for electricity system operators, both at transmission and distribution levels, to publish and update information on the grid capacity available in their areas of operation would contribute to decision-making by investors on the basis of information of grid capacity</p>	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

availability within the system and thus to the required acceleration in the deployment of renewable energy.	
(42) Furthermore, to tackle the problem of lengthy reply times on requests for connection to the grid, transmission and distribution system operators should provide clear and transparent information to system users about the status and treatment of their connection requests. Transmission and distribution system operators should endeavour to provide such information within a period of three months from the submission of the request.	
(43) During the energy crisis, consumers have been exposed to extremely volatile wholesale energy prices and had limited opportunities to engage in the energy market. Consequently, many households, have been facing difficulties when paying their bills. Vulnerable consumers and the energy poor are	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

the hardest hit ¹³ , but middle-income households have also been exposed to such difficulties. It is therefore important to update consumer rights and protections, allowing consumers to benefit from the energy transition, decouple their electricity bills from short term price movements on energy markets and rebalance the risk between suppliers and consumers.	
(44) Consumers should have access to a wide range of offers so that they can choose a contract according to their needs. However, suppliers have reduced their offers, fixed-price contracts have become scarce, and the choice of offers has become limited. Consumers should always have the possibility to opt for an affordable fixed price and fixed term contract and suppliers should not unilaterally modify the terms and conditions before such contract	

¹³ Particular groups are more at risk of being affected by energy poverty or more susceptible to the adverse impacts of energy poverty, such as women, persons with disabilities, older persons, children, and persons with a minority racial or ethnic background.

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

expires. This does not change the fact that dynamic price contracts remain essential and with an increasing penetration of renewable energy sources can help consumers to reduce their energy bills.	
(45) When suppliers' do not ensure that their electricity portfolio is sufficiently hedged changes in wholesale electricity prices can leave them financially at risk and, result in their failure, passing on costs to consumers and other network users. Hence, it should be ensured that suppliers are appropriately hedged when offering fixed price contracts. An appropriate hedging strategy should take into account the suppliers' access to its own generation and its capitalisation as well as its exposure to changes in wholesale market prices. The existence of appropriate hedging strategies can be ensured by general rules overseen without undertaking a specific review of the positions or strategies of individual suppliers.

<p>(46) Consumers should be able to choose the supplier which offers them the price and service which best suits their needs. Advances in metering and sub-metering technology combined with information and communication technology mean that it is now technically possible to have multiple suppliers for a single premises. If they so wish, customers should be able to use these possibilities to choose a separate supplier notably for electricity to power appliances such as heat pumps or electric vehicles which have a particularly high consumption or which also have the capability to shift their electricity consumption automatically in response to price signals. For this purpose, customers should be allowed to have more than one metering and billing point covered by the single connection point for their premises. The rules for the allocation of the associated costs should be determined at national level. Some smart</p>	<p>IE:</p> <p>(Comments):</p> <p>Original comment</p> <p>Customers in Ireland have always had the ability to have more than one metering and billing point – however, they have had to pay for those additional connections.</p> <p>I think this is trying to get at the idea of one connection and meter point that allows the consumption to be allocated to different suppliers through sub-metering. This should be technically feasible in Ireland, but will require significant IT system changes and is likely to take a number of years to implement.</p> <p>REV 2 Comment</p> <p>Clarifications in the drafting are helpful re. metering devices\measurement devices.</p>
--	--

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>metering systems may directly cover more than one metering point and therefore enable customers to have more than one electricity supply contract at the same time. Moreover, with fast-responding dedicated measurementmetering devices which are attached to or embedded in appliances with flexible, controllable loads, final customers can participate in other incentive-based demand response schemes that provide flexibility services on the electricity market and to transmission and distribution system operators. Overall, such arrangements should contribute to the increased uptake of demand response and to consumer empowerment allowing them to have more control over their energy use and bills, while providing to the electricity system additional flexibility in order to cope with demand and supply fluctuations.</p>	
(47) Due to the increasing complexity of energy offers and different marketing practices,	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>consumers have often difficulties to fully understand what they sign up to. In particular, there is a lack of clarity on how the price is set, the conditions for the renewal of the contract, the consequences of terminating a contract or the reasons for changing conditions by the supplier. Therefore, the key information on energy offers should be provided to consumers by suppliers or market participants engaged in aggregation in a short and easily understandable manner prior to signing the contract.</p>	
<p>(48) To ensure continuity of supply for consumers in particular in cases of supplier failure, Member States should be obliged to implement a supplier-of-last-resort regime. Such a supplier of last resort appoint suppliers of last resort which may be treated as the provider of universal service. A That supplier of last resort might be the sales division of a vertically integrated undertaking which also performs distribution -functions, provided that it</p>

meets the unbundling requirements of Article 35 of Directive (EU) 2019/944 of the European Parliament and of the Council. However, this does not imply an obligation of Member States to supply at a certain fixed minimum price.	
(49) Energy sharing can create resilience against the effects of high and volatile wholesale market prices on consumers' energy bills, empowers a wider group of consumers that do not otherwise have the option of becoming an active customer due to financial or spatial constraints, such as energy poor and vulnerable consumers, and leads to increased uptake of renewable energy by mobilising additional private capital investments and diversifying remuneration pathways. With the integration of appropriate price signals and storage facilities, electricity sharing can help lay the foundation to help tap into the flexibility potential of smaller consumers.	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>(50) Active customers that own, lease or rent a storage or generation facility should have the right to share excess production at a price or free of charge and empower other consumers to become active, or to share the renewable energy generated or stored by jointly leased, rented or owned facilities, either directly or through a third-party facilitator. Any payment for sharing of excess production for a price can either be settled directly between active customers or automated through a peer-to-peer trading platform. Energy sharing arrangement are either based on private contractual agreement between active customers or organised through a legal entity. A legal entity that incorporates the criteria of a renewable energy community as defined in Directive (EU) 2018/2001 of the European Parliament and of the Council or a citizen energy community as defined in Directive (EU) 2019/944 of the European Parliament and of the Council can share with their members electricity</p>	<p>BE:</p> <p>(Comments):</p> <p>The link between the right to share renewable energy provided through this reform and the provisions already in force in the EMD directive and the RED directive regarding :</p> <ul style="list-style-type: none"> - Renewable and non-renewable energy/electricity sharing through energy community → CEC (article 16 EMD) and REC (article 22 RED) - Renewable energy sharing within the same building as jointly acting renewables self-consumers (article 21, § 4 RED) - Peer-to-peer trading arrangement of renewable energy by self-consumer (article 21, § 2, a) RED) <p>should be specify in this recital. Because the links are not clear and this reform brings confusion regarding those various concepts.</p> <p>IE:</p> <p>(Comments):</p> <p>Original comment</p> <p>I think the changes made are positive and provide clarity.</p> <p>In relation to the reference to “free of charge”, it should be clear that energy sharing makes use of the network and therefore, it is appropriate and fair that network charges may apply.</p>

<p>financially responsible for imbalances they cause. This should be without prejudice to the possibility for active customers to delegate their balancing responsibilities to other market participants. –Sshall be shall All consumer rights and obligations in this Directive apply to final customers involved in energy sharing schemes. However, households with an installed capacity up to 10.8 kW for single households and up to 50 kW for multi-apartment blocks should not be required to comply with the obligations of suppliers.</p>	<p>electricity injected into the grid by more than one jointly acting active customers. Member States should put in place the appropriate IT infrastructure to allow for the administrative matching within a certain timeframe of consumption with self-generated or stored renewable energy for the purpose of calculating the energy component of the energy bill and taking it into consideration for the Balancing Responsible Party allocation process.</p> <p>The output of these facilities should be distributed among the aggregated consumer load profiles based on static, variable or dynamic calculation methods that can be pre-defined or agreed upon by the active customers.</p> <p>IE:</p> <p>(Comments):</p> <p>In order to perform the netting of the shared electricity with the total metered consumption within a time interval no longer than the imbalance settlement period, as mentioned in the new Art. 15a, paragraph 1(d) to the Electricity Directive (see below), the matching should be calculated based on measurements provided by (smart) meters and dedicated metering devices.</p> <p>Original comment</p> <p>Regarding the final sentence, it is important to recognize the definition of a consumer in other legislation, for example the Consumer Rights Act 2022:</p> <p>“consumer” means an individual acting for purposes that are wholly or mainly outside that individual’s trade, business, craft or profession</p>
---	--

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	It is unclear how the requirements of a domestic customer (consumer) with capacity above 10.8kW would be required to take on responsibilities associated with a commercial entity.
(52) Vulnerable customers should be adequately protected from electricity disconnections and should, as well, not be put in a position that forces them to disconnect. The role of suppliers and all relevant national authorities to identify appropriate measures, in both the short and the long-term, which should be made available to vulnerable customers to manage their energy use and costs remain essential, including by means of close cooperation with social security systems.	
(53) Public interventions in price setting for the supply of electricity constitute, in principle, a market-distortive measure. Such interventions may therefore only be carried out as public service obligations and are subject to specific conditions. Under this Directive regulated prices are possible for energy poor and vulnerable

households, including below costs, and, as a transition measure, for households and micro-enterprises. In times of crisis, when wholesale and retail electricity prices increase significantly, and this is having a negative impact on the wider economy, Member States should be allowed to extend, temporarily, the application of regulated prices also to SMEs. For both households and SMEs, Member States should be temporarily allowed to set regulated prices below costs as long as this does not create distortion between suppliers and suppliers are compensated for the costs of supplying below cost. However, it needs to be ensured that such price regulation is targeted and does not create incentives to increase consumption. Hence, such price regulation should be limited to 80% of median household consumption for households, and 70% of the previous year's consumption for SMEs. ~~The Commission should determine when such an electricity price crisis exists and consequently when this possibility becomes~~

Amendments to Regulation (EU) 2019/943 of the European Parliament and of the Council of 5 June 2019 on the internal market for electricity	
Regulation (EU) 2019/943 is amended as follows:	
	<p>BE:</p> <p>(Drafting):</p> <p>[a0] point (a) is amended as follows:</p> <p>(a) set the basis for an efficient achievement of the objectives of the Energy Union and in particular the climate and energy framework for 2030 by enabling market signals to be delivered for increased efficiency, higher share of renewable energy sources, security of supply, flexibility, sustainability, decarbonisation and innovation; where needed complemented by efficient state aid procedures;</p> <p>BE:</p> <p>(Comments):</p> <p>We propose to make slight adaption to art1 (a) of the existing regulation</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	All objectives of article 1 refer to the market (or here “market signals”), whereas the Regulation also foresees rules for aid measures complementary to the market (adequacy through CRM’s, and now also flexibility through flexibility support).
(1) Article 1 is amended as follows:	
[a] point (b) is replaced by the following:	
‘(b) set fundamental principles for well-functioning, integrated electricity markets, which allow all resource providers and electricity customers non-discriminatory market access, enable the development of forward electricity markets to allow suppliers and consumers to hedge or protect themselves against the risk of future volatility in electricity prices, empower consumers, ensure competitiveness on the global market, enhance flexibility through demand response, energy storage and other non-fossil flexibility solutions, ensure energy efficiency, facilitate aggregation of distributed demand and supply, and enable	<p>BE:</p> <p>(Drafting):</p> <p>‘(b) set fundamental principles for well-functioning, integrated electricity markets, which allow all resource providers and electricity customers non-discriminatory market access, enable the development of forward electricity markets to allow suppliers and consumers to hedge or protect themselves against the risk of future volatility in electricity prices, empower consumers, ensure competitiveness on the global market, enhance flexibility and security of supply through demand response, energy storage and other non-fossil flexibility solutions, ensure energy efficiency, facilitate aggregation of distributed demand and supply, and enable market and sectoral integration and suitable market-based remuneration of electricity generated from renewable sources</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

market and sectoral integration and market-based remuneration of electricity generated from renewable sources;'	
[b] the following point is added:	
'(e) support long-term investments in renewable energy generation and enable consumers' to make their energy bills less dependent on from fluctuations of short-term electricity market prices, in particular fossil fuel prices in the medium to long-term.'	<p>DK:</p> <p>(Drafting):</p> <p>'(e) support long-term investments in renewable energy generation and enable consumers' to <u>make-manage risks in</u> their <u>energy-electricity</u> bills <u>less dependent from due to</u> fluctuations of short-term electricity market, <u>in particular fossil fuel prices in the medium to long-term.</u>²</p> <p>DK:</p> <p>(Comments):</p> <p>It is important that the electricity regulation ensures market-friendly support of renewables and avoids schemes that distort short-term and long-term markets.</p> <p>For consumers it is important to handle their risks and not in any case make bills independent of short-term prices.</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

(2) In Article 2, the following points are added:	
‘(72) ‘peak hour’ means an hour with the highest electricity consumption combined with a low level of electricity generated from renewable energy sources, taking cross-zonal exchanges into account;	<p>FI:</p> <p>(Comments):</p> <p>Definition of peak hour should take into account the fact that peak hours for consumption and peak hours for the system are not necessarily the same. For this reason, the peak hours should be defined on the overall assessment of the system balance not just based on the sum of consumption and production of renewables.</p> <p>IE:</p> <p>(Drafting):</p> <p>‘(72) ‘peak hour’ means an hour with the highest electricity consumption and/or a low level of electricity generated from renewable energy sources, taking cross-zonal exchanges into account;</p> <p>IE:</p> <p>(Comments):</p> <p>It would be helpful if we could consider a peak hour an hour with peak emissions also; this would allow the product to be used as a means of actively managing emission intensity on the system by the TSO.</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

(73) 'peak shaving' means the ability of market participants to reduce electricity consumption at peak hours determined by the transmission system operator;	<p>BE:</p> <p>(Comments):</p> <p>Peak shaving is a general concept that is also used in other contexts and markets. For example when a consumers wants to lower his power peaks towards the DSO in order to pay a lower distribution tarif or to not exceed his connection capacity. In order to avoid confusion, we suggest to change or specify name of this definition.</p>
(74) 'peak shaving product' means a market-based product through which market participants can provide peak shaving to the transmission system operators;	
(75) 'virtual hub' means a non-physical region covering more than one bidding zone for which an index price is set in application of a methodology;	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>(76) ‘two-way contract for difference’ means a contract signed between a power generating facility operator and a counterpart, usually a public entity, that provides both minimum remuneration protection and a limit to excess remuneration; the contract is designed to preserve incentives for the generating facility to operate and participate efficiently in the electricity markets and complies with the principles set out in Article 4(2) and Article 4(3), first and third subparagraphs, of Directive (EU) 2018/2001;</p>	<p>ES:</p> <p>(Drafting):</p> <p>(76) ‘two-way contract for difference’ means a contract signed between a power generating facility operator and a counterpart, usually a public entity, that provides both minimum remuneration protection and a limit to excess remuneration; the contract is designed to preserve incentives for the generating facility to operate and participate efficiently in the electricity markets in a market-responsive way, so as to maximise the integration of electricity from renewable sources and complies in accordance with the principles set out in Article 4(2) and Article 4(3), first and third subparagraphs, of Directive (EU) 2018/2001;</p> <p>BE:</p> <p>(Comments):</p> <p>Could it be clearly explicated in a recital that this provisions on ‘two-way contract for difference’ is applicable to all generation sources?</p>
<p>(77) ‘power purchase agreement’ or ‘PPA’ means a contract under which a natural or legal person agrees to purchase electricity from an electricity producer on a market basis;</p>	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

(78) ‘market revenue’ means realised income an electricity producer receives in exchange for the sale and delivery of electricity in the Union, regardless of the contractual form in which such exchange takes place, and excluding any support granted by Member States;	<p>BE:</p> <p>(Comments):</p> <p>Why was this definition deleted?</p> <p>Are there not also not other forms of income that can also be relevant? For example remuneration for the availability of power generating capacity, storage or demand response ?</p>
(79) ‘dedicated measurement metering device’ means a device attached to or embedded in an asset that provides sells demand response or flexibility services on the electricity market or to transmission and distribution system operators;	<p>BE:</p> <p>(Comments):</p> <p>Is a ‘dedicated measurement’ different from a submeter?</p> <p>Is this only to be used for flexibility or demand response services? Or can this also be used as a metering device for a separate electricity contract e.g. for an EV (linked to the right to have more than one contract in article 4)?</p> <p>IE:</p> <p>(Drafting):</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>‘dedicated metering device’ means a device attached to or embedded in an asset that sells demand response or flexibility services on participates in the electricity market or provides flexibility services to transmission and distribution system operators;</p> <p>IE:</p> <p>(Comments):</p> <p>Data from dedicated metering devices should allow consumers’ assets to participate in the electricity market and provide flexibility services to system operators.</p>
<p>(80) ‘flexibility’ means the ability of an electricity system to adjust to the variability of generation and consumption patterns and grid availability, across relevant market timeframes.’</p>	<p>BE:</p> <p>(Comments):</p> <p>Can the com explain why she considers it necessary to introduce a definition since the term flexibility was already used in in the 2019/944 directive but it was not defined then? The focus in this directive was mostly on ‘demand response’ and which was defined in this directive. -what is the link between this notion and the notions of demand response and flexibility services/schemes used in the EMD Directive?</p> <p>What is the relation between this definition of ‘flexibility’ and the definition of ‘demand response’? Is ‘demand response’ as defined in the 2019/944 directive a form of explicit</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>flexibility?</p> <p>What is the scope of this definition? Can 'Flexibility be seen as as both implicit flexibility (e.g. ToU tariffs or dynamic price contracts) and explicit flexibility (e.g. balancing products like FCR/aFRR or congestion products from the DSO) which include flexible sources like demand respons, energy storage and flexibele production?</p>
(3) Article 7 is amended as follows:	
[a] paragraph 1 is replaced by the following:	
<p>‘1. Transmission system operators and NEMOs, or an entity designated by them, shall jointly organise the management of the integrated day-ahead and intraday markets in accordance with Regulation (EU) 2015/1222. Transmission system operators and NEMOs shall cooperate at Union level or, where more appropriate, at a regional level in order to maximise the efficiency and effectiveness of</p>	<p>IT:</p> <p>(Drafting):</p> <p>1. “Transmission system operators and NEMOs, or an entity designated by them, shall jointly organise the management of the integrated day-ahead and intraday markets in accordance with Regulation (EU) 2015/1222. Transmission system operators and NEMOs shall cooperate at Union level or, where more appropriate, at a regional level in order to maximise the efficiency and effectiveness of Union electricity day-ahead and intraday</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>Union electricity day-ahead and intraday trading. The obligation to cooperate shall be without prejudice to the application of Union competition law. In their functions relating to electricity trading, transmission system operators and NEMOs shall be subject to regulatory oversight by the regulatory authorities pursuant to Article 59 of Directive (EU) 2019/944 and ACER pursuant to Articles 4 and 8 of Regulation (EU) 2019/942.’</p>	<p>trading. The obligation to cooperate shall be without prejudice to the application of Union competition law. In their functions relating to electricity trading, transmission system operators and NEMOs shall be subject to regulatory oversight by the regulatory authorities pursuant to Article 59 of Directive (EU) 2019/944 and ACER pursuant to Articles 4 and 8 of Regulation (EU) 2019/942.’</p> <p>IT:</p> <p>(Comments):</p> <p>The provisionl, to be considered together with the one on art. 59, appears to violate the principle of proportionality as it’s not functional to achieving the objectives of the market design revision under discussion.</p> <p>Those proposals appear to be meant to create a legal basis for a modification of the Capacity Allocation and Congestion Management Regulation – CACM (that’s an implementing act as referred to in art 59), by which the operational management of Single Day Ahead Coupling (SDAC) and of Single Intraday Coupling (SIDC) can be performed by a "Single Legal Entity" (SLE); this possibility represents a significant reform in European governance of the electricity markets - of absolute strategic importance for each Member State – that would be, taking on board the amendement proposed by the Commission, through a decision by a technical body (Commission or ACER through the procedures of an implementing act) instead of passing through a legislative procedure as the relevance of the issue under discussion would require .</p>
---	--

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

[b] paragraph 2 is amended as follows:	
(i) point (c) is replaced by the following:	
(c) maximise the opportunities for all market participants to participate in cross-zonal and intra-zonal trade in a non-discriminatory way and as close as possible to real time across and within all bidding zones;	<p>FI:</p> <p>(Comments):</p> <p>We support this qualitative requirement.</p>
(ii) the following point (ca) is inserted:	
‘(ca) be organised in such a way as to ensure the sharing of liquidity between all NEMOs, both for cross-zonal and for intra-zonal trade;’	<p>FI:</p> <p>(Comments):</p> <p>We fully support this provision as it is important in creating a level playing field among the NEMOS.</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

(4) the following Articles 7a and 7b are inserted:	
Article 7a	<p>BE:</p> <p>(Comments):</p> <p>Can the Commision explain what is the intention of this newly introduced product? Is this focussed on Securtiy of Supply or is the intention that this could also be usefull for congestion ?</p> <p>Can the COM give some more information how this procuct would interagate with existing products (as existing TSO products) ?</p> <p>Can the com give more information on how this would interage with the Security of Supply calibration?</p> <p>Can the com give some more information why she proposed to limit the use of this new product only to the TSO and not open it for the DSO?</p>
Peak shaving product	<p>FI:</p> <p>(Comments):</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>The provision has changed to a good direction. Cost benefit analysis on peak shaving product is a good addition as well as clearer optionality to the use of the product is a positive development.</p> <p>The use of the peak shaving product should be a Member State decision in case the product is used for resource adequacy. Also, there should be more flexibility for contracting so that there could be a framework agreement for the procurement of such products.</p>
<p>1. Without prejudice to Article 40(5) and 40(6) of the Electricity Directive, transmission system operators may procure peak shaving products in order to achieve a reduction of electricity demand during peak hours.</p>	<p>IE:</p> <p>(Drafting):</p> <p>Without prejudice to Article 40(5) and 40(6) of the Electricity Directive, transmission system operators or distribution system operators may procure peak shaving products in order to achieve a reduction of electricity demand during peak hours.</p> <p>IE:</p> <p>(Comments):</p> <p>Leaving a peak shaving product with the TSO only will result in limited liquidity in the flexibility markets and a decrease in the use of flexibility services. Flexibility services are a key component of meeting both Irelands and the EUs climate targets. Flexible services are a key aspect of Article 32 of EU Directive 2019/944 (and the subsequent Price Review 5 Decision published by the Irish utility Regulatory Authority (CRU20154)). This Directive requires Member States to provide the necessary regulatory framework to allow and provide incentives to distribution system operators to procure</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	flexibility services, including congestion management in their areas, in order to improve efficiencies in the operation and development of the distribution system. Peak shaving products are already a key part of implementing congestion management and the associated products
2. Transmission system operators seeking to procure a peak shaving product shall submit a proposal setting out the dimensioning and conditions for the procurement of the peak shaving product to the regulatory authority of the Member State concerned. The proposal of the transmission system operator shall comply with the following requirements:	<p>FI:</p> <p>(Comments):</p> <p>It should be clear what is the system need the product fulfils. Currently, the proposal refers to overall security of supply that is not a TSO task. Therefore the provision should be formulated so that the product fulfils a system need or the task. Other option is give the decision to and dimensioning to the MS.</p> <p>The procurement of the peak shaving product shall avoid any impact on the day-ahead, intraday or balancing market and this needs to be taken into consideration in the criteria.</p> <p>IE:</p> <p>(Drafting):</p> <p>Transmission system operators or distribution system operators seeking to procure a peak shaving product shall submit a proposal setting out the dimensioning and conditions for the procurement of the peak shaving product to the regulatory authority of the Member State concerned. The proposal of the transmission system operator shall comply with the following requirements:</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>IE:</p> <p>(Comments):</p> <p>Leaving a peak shaving product with the TSO only will result in limited liquidity in the flexibility markets and a decrease in the use of flexibility services. Flexibility services are a key component of meeting both Irelands and the EUs climate targets.</p> <p>Flexible services are a key aspect of Article 32 of EU Directive 2019/944 (and the subsequent Price Review 5 Decision published by the Irish utility Regulatory Authority (CRU20154)). This Directive requires Member States to provide the necessary regulatory framework to allow and provide incentives to distribution system operators to procure flexibility services, including congestion management in their areas, in order to improve efficiencies in the operation and development of the distribution system. Peak shaving products are already a key part of implementing congestion management and the associated products</p>
<p>(a) the dimensioning of the peak shaving product shall be based on an analysis of the need for an additional service to ensure security of supply. The analysis shall take into account- a cost and benefits reliability standard and or objective and transparent grid stability criteria approved by the regulatory authority. The dimensioning shall take into account the</p>	<p>BE:</p> <p>(Drafting):</p> <p>[...]</p> <p>The dimensioning shall take into account the forecast of demand, the forecast of electricity generated from renewable energy sources and the forecast of other sources of flexibility in the system as well as the wholesale price impact of the avoidable dispatch of high marginal cost peak generating capacity . The dimensioning of the peak shaving product shall be limited to ensure that the expected benefits of the product do not exceed the forecasted</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>forecast of demand, the forecast of electricity generated from renewable energy sources and the forecast of other sources of flexibility in the system. The dimensioning of the peak shaving product shall be limited to ensure that the forecasted costs do not exceed pected the expected benefits of the product do not exceed the forecasted costs;</p>	<p>costs;</p> <p>DK:</p> <p>(Drafting):</p> <p>(a) the dimensioning of the peak shaving product shall be based on an analysis of the need for an additional service to ensure security of supply. The analysis shall take into account a cost and benefits reliability standard and or objective and transparent grid stability criteria approved by the regulatory authority or another competent authority designated by the Member State.</p> <p>DK:</p> <p>(Comments):</p> <p>In Denmark this competence is placed politically and technically with the Danish Energy Agency, and not the regulatory authority, as it is linked to ensure security of supply. DK emphasizes the need for MS to choose the authority which must approve the "grid stability criteria".</p> <p>It is still unclear what is defined by "grid stability criteria". It is DKs understanding that this is an energy- and grid technical assessment, with security of supply viewpoints</p>
	<p>FI:</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>(Drafting):</p> <p>(aa) procurement of the peak shaving product shall avoid negative impacts on the functioning of day-ahead, intraday or balancing market</p> <p>FI:</p> <p>(Comments):</p> <p>New criterion to ensure that the procured capacity can offer to day-ahead markets and balancing markets in case it is not activated. Also, the process needs to be designed so that the market effect is take into account and mitigated.</p>
<p>(b) the procurement of a peak shaving product shall be based on objective, transparent, non-discriminatory criteria and be limited to demand response;</p>	<p>FI:</p> <p>(Drafting):</p> <p>(b) the procurement of a peak shaving product shall be based on objective, transparent, and non-discriminatory criteria and be limited to demand response;</p> <p>FI:</p> <p>(Comments):</p> <p>This provision cannot be monitored behind the meter so we propose deleting it and widening the scope.</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>(c) the procurement of the peak shaving product shall take place using a competitive bidding process, with selection based on the lowest cost of meeting pre-defined technical and environmental criteria;</p>	<p>BE:</p> <p>(Drafting):</p> <p>(c) the procurement of the peak shaving product shall take place using a continious competitive bidding process, with selection based on the lowest cost of meeting pre-defined technical and environmental criteria;</p>
<p>(d) contracts for a peak shaving product shall not be concluded more than two days before its activation and the contracting period shall be no longer than one day;</p>	<p>BE:</p> <p>(Drafting):</p> <p>(d) — contracts for a peak shaving product shall not be concluded more than two days before its activation and the contracting period shall be no longer than one day;</p> <p>BE:</p> <p>(Comments):</p> <p>This paragraph is too limiting. The development and investment in such products also requires secured longer term forward revenue streams. A daily product only will not incentivize investments sufficiently. Different products in different timeframes should be allowed (e.i. yearly, seasonal, monthly, weekly and daily)</p> <p>FI:</p> <p>(Drafting):</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>d) the contracting period for future availability shall be no longer than one year;</p> <p>FI:</p> <p>(Comments):</p> <p>There should be more flexibility in the contracting e.g. in the form of a framework agreement from which the product could be activated. The product could be then be activated in case the bid in the day-ahead market did not pass.</p>
(e) the activation of the peak shaving product shall not reduce cross-zonal capacity;	
(f) the activation of the peak shaving product shall take place after the closure of the day-ahead market and before the start of the balancing market;	<p>IE:</p> <p>(Drafting):</p> <p>(f)the activation of the peak shaving product shall take place after the closure of the day-ahead market and with sufficient lead time before the start-closure of the balancing energy market;</p> <p>IE:</p> <p>(Comments):</p> <p>The balancing market can consist of balancing capacity and balancing energy market. Impact of the peak-shaving product on the existing balancing capacity</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	markets, which start in most cases with longer lead times (e.g., week ahead, in some cases even month or year ahead) and close for the most part before the day ahead market closure, should be avoided. Hence the focus should be on the balancing energy market only. With the proposed technical adjustment of the wording this is granted, and impact on established processes of the balancing energy markets can as well be limited.
(g) the peak shaving product shall not imply starting generation located behind the metering point.	<p>BE:</p> <p>(Comments):</p> <p>How about storage?</p> <p>FI:</p> <p>(Drafting):</p> <p>Delete.</p> <p>FI:</p> <p>(Comments):</p> <p>At least in Finland there is requirement to measure generation units greater than 100 kVA. It is important to acknowledge that generation is impossible to distinguish between demand reduction and generation below this threshold. Thus, in order to avoid very heavy administrative and technical burdens small scale generation has to be considered as demand response.</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>3. The actual reduction of consumption resulting from the activation of a peak shaving product shall be measured against a baseline, reflecting the expected electricity consumption without the activation of the peak shaving product. Where a transmission system operator decides to procure a peak shaving product in accordance with paragraph 1 it Transmission system operators shall develop a baseline methodology in consultation with market participants and submit it to the regulatory authority.</p>	<p>BE:</p> <p>(Drafting):</p> <p>3. The actual reduction of consumption offtake resulting from the activation of a peak shaving product shall be measured against a baseline, reflecting the expected electricity consumption without the activation of the peak shaving product. [..]</p> <p>BE:</p> <p>(Comments):</p> <p>Consumption=/offtake with local production and storage</p> <p>We feel that an individual baseline may not be the best method to apply to smaller consumers or net users connected to the low voltage grid if they want to participate (optionally through aggregation) to this product. So alternative methodologies to individual baselining should be an option.</p> <p>IE:</p> <p>(Drafting):</p> <p>The actual reduction of consumption resulting from the activation of a peak shaving product shall be measured against a baseline, reflecting the expected electricity consumption</p>

	<p>real time as possible is important especially for the vRES-generators.</p> <p>IE:</p> <p>(Drafting):</p> <p><u>1.</u> ‘NEMOs shall allow market participants to trade energy as close to real time as possible and at least up to the intraday cross-zonal gate closure time. By 1 January 2028, the intraday cross-zonal gate closure time shall be at the earliest 30 minutes ahead of real time.’</p> <p>By 1 January 2026 all TSOs shall perform a joint impact assessment of the Intraday cross-zonal gate closure time shortening on national system security, cost efficiency, RES integration and CO2 emissions. Based on such assessment, all TSOs may propose an amendment to the methodology derived from Art. 59 of EC Regulation 2015/1222.</p> <p>IE:</p> <p>(Comments):</p> <p>Introducing a mandatory EU-wide predefined timing on intraday gate closure time without any impact assessment on systems security and system-wide CO2 emissions is inadequate at this stage. This would have severe consequences for many TSOs in Europe, requiring a complete change in how they operate their systems and potentially compromising system security in their countries. Shorter Intraday Gate Closure Times could be introduced where necessary – provided this is compatible with operational constraints which also depend on the different balancing approaches by TSOs. Therefore EirGrid also propose to do an impact assessment by 1. January 2026.</p>

	<p>The outcome of this assessment will define if it is necessary to propose amendment via the Capacity Allocation and Congestion Management Guideline (CACM) 30-min intraday gate closure time means the balancing timeframe (where TSOs can take measures to ensure the balance and security of the system by activating reserves procured on the balancing marker) would start only 30 minutes before real time. As a consequence:</p> <ul style="list-style-type: none"> — TSOs operation would be impacted by a shorter timeframe to secure the system balance when unforeseen events occur: reducing TSO's operational window to 30 min may require more reserves with short activation times (automatic and manual reserves) to correct system imbalance and solve intra-zonal congestions. — TSOs applying a proactive balancing approach would see a shortage of flexibility resources available: all units which take more than 20 minutes to be activated could no longer be used as balancing resources, reducing the leverages for TSOs to ensure stable system operation and safe energy delivery. — The Replacement Reserve product would have to be terminated (as it has a full activation time of 30 min), including the European reserve sharing platform TERRE, which was established in implementation of EU law and is successfully operating since 2020. — System operation costs could substantially increase for TSOs applying a proactive balancing approach, as moving away from the Replacement Reserve product to more expensive products with shorter activation time will increase balancing costs borne by all grid users. — CO2 emissions may also increase, as generation units able to provide balancing bids close to real time are in many countries mostly high emission thermal units <p>We acknowledge how intraday trading closer to real time can facilitate the participation of RES (which have more reliable forecast the closer to real time, due to their weather dependency), especially where their participation in balancing services is still limited. In the future, shorter intraday gate closure times could be introduced where needed – subject to a thorough impact assessment, positive cost-benefit analysis, and compatibility with future operational constraints.</p> <p>Further input</p> <p>Intraday gate closure time (IDGCT) drafting is unchanged. It points to intraday as being of</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

critical importance to renewables as their forecast risk is high until very short notice, and they therefore should have the opportunity to continue trading until as close to real time as possible. The text requires that the NEMOs make the IDGCT 30 minutes by 2028.

This topic was negotiated at length between NRAs and ACER for the CEER-ACER position, but it appears that this wasn't taken on board at all (ACERs position was that the move to 30 minutes should be supported by a TSO analysis, and ACER decision, rather than assuming that 30 mins was beneficial no matter what. Moving to 30 minutes for markets that have a central dispatch system creates challenges, and in particular, creates a possible deadzone where trading can continue between market participants, but TSOs cannot include the outcome of those trades in their decision-making. This is quite inefficient obviously. The 30 minute gate closure time is probably helpful for small aggregators and storage operators too but as long as you are central dispatch, or use an integrated scheduling process, 30 mins is very hard to implement, or just doesn't make sense (as you end up ignoring the results of those trades). I expect that ACER-CEER will reiterate its position on this point. This position will be strongly supported by the Italians, Spanish, Polish and probably the French too.

CEER-ACER Justification

The costs and benefits of shortening the intraday cross-zonal gate closure time are not obvious. Close to real time the system can be balanced either by market participants or 12 by the TSO. While market participants prefer to balance themselves close to real time, this may not be necessarily more efficient for the whole system as it depends whether TSOs have, in the last 30 minutes, enough reserves to balance the system. Therefore, these amendments aim to provide room for a proper review of its feasibility and cost benefit analysis by ENTSO-E and subject to such review, ACER would make a decision on the intraday cross-zonal gate closure time.

DK:

(Drafting):

1. 'NEMOs shall allow market participants to trade energy as close to real time as possible

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>and at least up to the intraday cross-zonal gate closure time. By 1 January 2028, the intraday cross-zonal gate closure time shall be at the earliest 30 minutes ahead of real time.’</p> <p>Implementation can be extended by 3 years, if it challenges security of supply.</p> <p>DK:</p> <p>(Comments):</p> <p>DK supports the aim of reducing gate-closure time but finds that it might require more time to implement the necessary system that ensure faster reaction. With shorter gate closure time, sufficient capacity must be ready to react in a shorter time frame as well.</p>
	<p>BE:</p> <p>(Comments):</p> <p>We would like to invite the PCY and the COM to add a an extra paragraph 1a to article 8 to ensure an better function of the market.</p> <p>This because we feel that the European Commission’s proposal does not sufficiently create a level playing field between competing NEMOs, as it does not require NEMOs to share order books in the last 60 minutes before delivery, between the closure of the single intraday market and the physical delivery of power, in those Member States where such trading during this period of time is allowed.</p> <p>Under the current legislation, NEMOs do not operate the local markets referred to above, which are allowed in some Member States. These are operated by power exchanges. An undertaking can be both a NEMO and a power exchange, but under the current EU and national legislation it is only</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>required to share its order books in those markets where it operates as a NEMO.</p> <p>This situation creates a barrier to entry to NEMOs wishing to enter these Member States, as:</p> <ul style="list-style-type: none"> - Only the incumbent NEMO can offer access to all available liquidity from the start of the day ahead coupling through to physical delivery. - Not all market participants that also wish to participate in these local markets are willing or able to pay two or more sets of NEMO/Power Exchange fees to access liquid markets also in the last 60 minutes before delivery, and - Due to the ever-increasing penetration of intermittent renewable sources, trading in the last 60 minutes is becoming ever more important to avoid imbalances. <p>In order to ensure the level playing field we feel that it is important to clearly clarify this also in current text proposal for review of the regulation.</p>
(b) paragraph 3 is replaced by the following:	
<p>3. ‘NEMOs shall provide products for trading in day-ahead and intraday markets which are sufficiently small in size, with minimum bid sizes of 100kW or less, to allow for the effective participation of demand-side response, energy storage and small-scale renewables including direct participation by customers.’</p>

propose having a gradual approach, where on the first phase the current LTTR market functioning is improved and after a sufficient analysis on the proposed changes to current model are conducted, a choice on the approach will be taken only then. Virtual Hubs should not be set as a target model without a proper impact assessment. Finland does not see how the proposal would improve price correlation in the Nordics. We also have hard time seeing how the proposal would enhance liquidity in the Nordics.

IE:

(Drafting):

The design of the Union's forward market shall be based on regional virtual hubs supported by at least long-term transmission rights issued by TSOs, allowing price risk hedging across bidding zones. By 1 December 2024 the ENTSO for Electricity shall submit to ACER, after having consulted ESMA, a proposal for the establishment of regional virtual hubs for the forward market. The proposal shall: **The design of the Union's forward market shall be based on regional virtual hubs supported by at least long-term transmission rights issued by TSOs, allowing price risk hedging across bidding zones.** **Transmission system operators or single allocation platform on their behalf, shall support the forward market by issuing long-term transmission rights and may have additional measures in place to allow for market participants, to hedge price risks across bidding zones.**

IE:

(Comments):

Virtual Hubs shouldn't be imposed as a target model for the whole of Europe. In the case of small markets like SEM VHs represent a very disruptive and uncertain approach. VHs are untested and have not been successfully adapted anywhere

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

else in Europe. The implementation timeframes are long and costs are high. In addition, the opportunity costs mean that other initiatives which are more important for the island of Ireland may not be delivered in time to reach renewable goals. There are better alternatives including more frequent auctions, additional product offerings and a detailed impact assessment that would identify the implications for liquidity.

The first amendment proposes to remove the legal deadline for submission of the methodology, since such legal deadline can only be established in the subsequently amended FCA Regulation. Two additional points (e) and (f) aim to provide further insight and comfort that are necessary before adopting the methodology and implementing the virtual hubs. If any feasibility and effectiveness concerns are identified this can be mitigated by the methodology and implementation plan. The addition also aims to provide sufficient time for market participants to adapt to the new model.

DK:

(Drafting):

The design of the Union's forward market shall be based on regional virtual hubs supported by at least long-term transmission rights issued by TSOs, allowing price risk hedging across bidding zones and virtuel hubs is best suited based on an impact assessment on the forward markets.

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>DK:</p> <p>(Comments):</p> <p>We would prefer, if the forward market was not narrowed down to only virtual hubs, as other designs could potentially be more efficient market designs, further the impact assessment should also investigate whether long-term transmissions rights should be used to support the virtual hubs or not.</p> <p>We therefore look forward to the impact assessment, that will provide a basis for discussion of the implementing act in the ECBC.</p>
<p><u>2. 24 months after [the entry into force of this Regulation] the Commission shall, after completing an impact assessment, adopt an implementing act in accordance with Article 59, that establishes the design referred to in paragraph 1. Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>(Comments):</p> <p>The single allocation platform itself is not an entity, it is operated by JAO. We do not support creation of the SAP as a standalone legal entity. According to Regulation (EU) 2016/1719 the Single Allocation Platform (SAP) means the European platform established by all TSOs for forward capacity allocation on their behalf – it has been meant as a central function, not a separate legal entity. As stated in All TSOs' proposal for the establishment of SAP, all TSOs examined several options when developing the SAP Proposal and concluded to appoint JAO, S.A., an existing entity owned by TSOs to operate the SAP on their behalf. This has been considered as the most efficient approach thanks to synergies with other JAO, S.A. activities in capacity allocation (non-EU border, shadow day-ahead auctions, intraday auctions, etc.)</p> <p>Since the suggested text is not based on an assessment on the efficiency and effectiveness over the current situation we believe that a less invasive and more effective solution is already in place. Further, the European Commission fails to prove that current governance framework does not allow efficient regulatory oversight of SAP performance.</p> <p>The proposal is also incomplete and inconsistent. From one side, the EC proposes a legal entity, on the other, TSOs remain fully responsible for the establishment of business processes and rules (Harmonized Allocation Rules, Requirements on SAP). Further, governance and foundation of such a legal entity is not clarified – e.g. who shall establish and own the entity, who shall manage it and to whom it shall report.</p> <p>Therefore, we suggest modifying the wording to clarify that the entity operating SAP is a legal entity, thus accountable for its performance.</p>
<p>2. Within six months of receipt of the proposal on the establishment of the regional</p>	<p>IE:</p>

All market operators shall be free to offer trading of financial hedging products linked to regional virtual hubs as referred to in paragraph 2.</p>
	<p>BE:</p> <p>(Drafting):</p> <p>7. By 31. December 2023 all TSOs shall submit to ACER and ESMA, a proposal of implementation of improvements to the current auctioning of financial longterm</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>transmission rights to be implemented by 1 January 2024. 1) The improvements shall consist of but not be limited to the following: a) Auctions for monthly, quarterly and yearly products; b) Product maturities up to three years; c) Development of a secondary market. Within three months of receipt of the proposal on improvements for the forward market, ACER and ESMA shall jointly evaluate it and either approve or amend it. The adopted proposal shall be published on ACER's website and is to be implemented by all TSOs within 3 months of the approval</p> <p>BE:</p> <p>(Comments):</p> <p>In complement to the elements of the request to the institutions to continue to work on virtual hub BE suggests a new paragraph to ensure swift implementation of already identified short-term measures to improve forward markets and auctioning of long-term transmission rights that will have an immediate effect while preparing and rolling out the virtual hubs. We consider it an important political signal from the reform that it gives a push to the improvement of forward markets ahead immediately, and in parallel with increased focus on PPAs/CfDs.</p>
(7) Article 18 is amended as follows:	
[a] paragraph 2 is replaced by the following:	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>“2. Tariff methodologies shall reflect the fixed costs of transmission system operators and distribution system operators and shall consider both capital and operational expenditure to provide appropriate incentives to transmission system operators and distribution system operators over both the short and long run, including anticipatory investments, in order to increase efficiencies, including energy efficiency, to foster market integration and security of supply, to support the use of flexibility services, efficient investments including solutions to optimise the existing grid and facilitate demand response and energy storage, related research activities, and to facilitate innovation in the interest of consumers in areas such as digitalisation, flexibility services and interconnection”;</p>	<p>BE:</p> <p>(Comments):</p> <p>BE thanks the PCY for the explicit inclusion of storage in this paragraph, we feel this is important.</p> <p>Did the commission consider to include also a provision in this article to ensure that the availability of firm financial transmission rights should be backed up with sufficient financial support for TSO's ?</p> <p>FI:</p> <p>(Comments):</p> <p>We support this proposal.</p>
<p>[b] paragraph 8 is replaced by the following:</p>	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>“8. Transmission and distribution tariff methodologies shall provide incentives to transmission and distribution system operators for the most cost-efficient operation and development of their networks including through the procurement of services. For that purpose, regulatory authorities shall recognise relevant costs as eligible, shall include those costs in transmission and distribution tariffs, and shall introduce performance targets in order to provide incentives to transmission and distribution system operators to increase efficiencies in their networks, including through energy efficiency, the use of flexibility services and the development of smart grids and intelligent metering systems.”</p>	<p>IE:</p> <p>(Drafting):</p> <p>[b] paragraph 8 is replaced by the following:</p> <p>“8. Transmission and distribution tariff methodologies shall provide incentives to transmission and distribution system operators for the most cost-efficient operation and development of their networks including through the procurement of services. For that purpose, regulatory authorities shall recognise relevant costs as eligible, shall include those costs in transmission and distribution tariffs, and shall may introduce, where applicable, appropriate performance targets in order to provide incentives to transmission and distribution system operators to increase efficiencies and quality and security of supply in their network, including through energy efficiency, the use of flexibility services and the development of smart grids and intelligent metering systems, in line with the characteristics of the given electricity system and climate policy objectives.”</p> <p>IE:</p> <p>(Comments):</p> <p>The establishment of KPIs based exclusively on efficiency would be too restrictive. The text should also encompass other aspects.</p> <p>Apart from that, NRAs should have flexibility to decide which tariff design is appropriate and fit for purpose. Since keeping track of such KPIs will require additional resources from both NRAs and TSOs, NRAs should decide if they see a benefit in introducing them or not, and they should be aligned with national features in any case.</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

[c] in paragraph 9, point (f) is replaced by the following:	
‘(f) methods to ensure transparency in the setting and structure of tariffs, including anticipatory investments;’	
[d] in paragraph 9, the following point (i) is added:	
‘(i) incentives for efficient investments in networks, including on flexibility resources and flexible connection agreements.’	<p>BE:</p> <p>(Comments):</p> <p>In Belgium this concept is applied, but provides insufficient firm capacity to the grid to incentivize investments in generation and storage capacity. TSO’s should receive incentives to provide and improve firm access, not to lower their responsibilities.</p>
[8] in Article 19, paragraph 2 is amended as follows:	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

[a] point (b) is replaced by the following:	
(b) maintaining or increasing cross-zonal capacities through optimisation of the usage of existing interconnectors by means of coordinated remedial actions, where applicable, or covering costs resulting from network investments that are relevant to reduce interconnector congestion; or	<p>BE:</p> <p>(Drafting):</p> <p>(b) maintaining or maximising and increasing cross-zonal capacities through optimisation of the usage of existing interconnectors by means of coordinated remedial actions, where applicable, or covering costs resulting from network investments that are relevant to reduce interconnector congestion; or</p> <p>FI:</p> <p>(Drafting):</p> <p>Delete.</p> <p>FI:</p> <p>(Comments):</p> <p>We have doubts on this requirement and would delete. Congestion income should not be used for this purpose.</p>
[b] the following point (c) is added:	IE:

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>(Drafting):</p> <p>[b] the following point (c) is added:</p>
<p>‘(c) compensating offshore generation plant operators in an offshore bidding zone if access to interconnected markets has been reduced in such a way that one or more transmission system operators have not made enough capacity available on the interconnector or the critical network elements affecting the capacity of the interconnector, resulting in the offshore plant operator not being able to export its electricity generation capability to the market.’</p>	<p>CZ:</p> <p>(Drafting):</p> <p>‘(c) compensating offshore generation plant operators in an offshore bidding zone if access to interconnected markets has been reduced in such a way that one or more transmission system operators have not made enough capacity available on the interconnector or the critical network elements affecting the capacity of the interconnector, resulting in the offshore plant operator not being able to export its electricity generation capability to the market.’</p> <p>CZ:</p> <p>(Comments):</p> <p>We consider this proposal to be breaching principles of the internal energy market, e.g. principles for fees for grid connection principles (art. 18 (1) of 2019/943 regulation), against cross-subsidies (art. 59 of 2019/944 directive), independence of NRAs (art. 57 of 2019/944 directive). It does not represent a cost-effective tool addressing the problem, but rather an implicit and intransparent subsidy. Our fear is also that this measure will be financed by MS that will not be directly affected by the benefits.</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>IE:</p> <p>(Drafting):</p> <p>‘(c) compensating offshore generation plant operators in an offshore bidding zone if access to interconnected markets has been reduced in such a way that one or more transmission system operators have not made enough capacity available on the interconnector or the critical network elements affecting the capacity of the interconnector, resulting in the offshore plant operator not being able to export its electricity generation capability to the market.’²</p> <p>IE:</p> <p>(Comments):</p> <p>Congestion income should not be used to finance support for offshore generators in hybrid projects nor any generation projects: this is not an effective support mechanism, would de facto be an implicit and non-transparent subsidy paid by consumers, and contradict internal markets principles.</p> <p>For generators in offshore hybrid projects with offshore bidding zones that do receive state support, we recommend available alternatives, such as well-designed Contracts for Difference (CfDs) decoupling remuneration from actual injection (see amendment proposals to article 19b on Direct price support mechanisms).</p> <p>The reasoning behind our proposed amendments is that it is not efficient to allocate the volume risk to individual project participants in hybrid projects, be it developers or TSOs, for whom the volume risk is outside of their control. Instead, volume risk is most efficiently allocated to Member States, as they are the ones best capable of managing this risk through:</p> <p>a) deciding whether or not offshore generation projects should be built as hybrid</p>

	<p>optional. This is one of the most important articles for the Netherlands in the upcoming reform.</p> <ul style="list-style-type: none"> ○ The Netherlands is critical about the mandatory nature of this article and strongly suggests to make the use of two-way CfDs for direct price support scheme optional. ○ Firstly, NL see the risk that ill-designed two-way CfDs reduce the incentives for producers to contribute to system integration and limiting systems costs. As NL will move to a system that is primarily based on wind and solar, this is a strong concern. ○ Secondly, NL believes that the mandatory use of two-way CfDs will lead to a higher subsidy need for renewable energy projects, since the developers of projects might take into account the revenue limits into their bids for support schemes. ○ Thirdly, NL has been supporting renewable energy projects and other types of projects in a cost-efficient and successful manner via the SDE-scheme. NL sees various significant risks for this existing scheme in the mandatory nature of two-way CfDs, which could slow down the roll-out of various renewable energy projects. <ul style="list-style-type: none"> ● Considering the use of two-way CfDs for repowering, increasing capacity and prolonging lifetime, we have the following remarks: <ul style="list-style-type: none"> ○ The Netherlands believes that clear and objective criteria are needed. The applications should only be possible where there is evidently significant investment or actual life extension. ○ We acknowledge that the addition of “substantially” is a (minor) step in the right direction. However, this still is not providing the comfort needed as “substantially” remains to be vague and intangible and thus does not differ that significantly from the previous proposal. ○ Therefore the Netherlands would like to have clarified how “substantially” is to be defined. Would this differ per technology? Is a percentage of the total investment cost or does it refer to specific investment?

	<p>electricity from the sources listed in paragraph 2 shall take the form of a-two-way contracts for differences. New investments for the generation of electricity shall include investments in new power-generating facilities <u>or</u>, investments aimed at <u>substantially</u>:</p> <p>1a. Two-way contracts for difference for new investments shall not incentivize the subjected generators to deviate their dispatch or price bidding from normal market behavior in Day-Ahead, Intraday and Balancing timeframe in the absence of a support scheme. In particular, Member States shall not make the payments under the support scheme conditional on the actual injection of the generator.</p> <p>IE:</p> <p>(Comments):</p> <p>CfDs must be very carefully designed to avoid distortions in short-term and balancing markets or increases in system costs. It's essential that price signals of Day-ahead, Intraday and balancing markets drive the use of the most efficient resources in every location and at every moment in time (e.g. disincentivising production at times of negative prices). This can be achieved by decoupling the remuneration of the CfD from the output of the generator such as with Capability-based CfDs</p> <p>With new paragraph 1a clearer principles are introduced to specify further in what way distortion-free CfDs should manifest: no incentive to change dispatch/pricing with regards to normal market functioning and, more precisely, not necessarily making the payments under the support scheme conditional to injection, so to allow efficient models such as Capability-based CfDs or Financial Wind CfDs.</p> <p>DK:</p> <p>(Drafting):</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

The first subparagraph shall not apply to investments in existing power-generating facilities that are subject to existing support schemes.

To protect investment certainty, the first subparagraph shall apply to contracts under direct price support schemes for new investments in generation, concluded as of one year after the date of where the tender is commenced later than three years after entry into force of this Regulation.

OR alternatively formulated as an exemption:

To protect investment certainty, the first subparagraph shall not apply to contracts under direct price support schemes for new investments in generation, concluded as of one year after the date of where the tender is commenced earlier than three years after entry into force of this Regulation.

DK:

(Comments):

We thank the presidency for trying to meet our concerns regarding the potential effects on projects that are already being planned.

Unfortunately, the proposal to exempt projects where contracts have been concluded will not be sufficient to address this, as the very large scale projects we are planning are already vastly advanced in terms of administrative and political preparatory work and planning even

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>though contracts are not yet concluded.</p> <p>We therefore propose to use the commencement of tenders instead, and we propose 3 years due to the timeline of our large scale projects. We propose two possible ways to do this.</p> <p>It is important to avoid creating instability and potentially delay important new projects, where political decisions have already been made. Such projects are therefore already in the planning phase, which starts several years before the tender, depending on the size of the project. This includes analysis, dialogue with the industry, financing etc. An immediate requirement to use CfDs would change the pipeline of existing projects, and would result in changes and potentially jeopardise the possibility to reach our common 2030 target.</p>
2. Paragraph 1 shall apply to new investments in generation of electricity from the following sources:	<p>CZ:</p> <p>(Drafting):</p> <p>Paragraph 1 shall apply to new investments in generation of electricity from the following low-carbon sources, meeting sustainability criteria.</p> <p>CZ:</p> <p>(Comments):</p>

production when prices are high and reduce production when prices are low;

IE:

(Comments):

Original Comment

The proposed amendment appears to only applies in a scenario where the market price is above the strike price, i.e., customers will be paid back on a MWh basis but when the market prices are below the strike price the customer pays support, as applicable, on a fix basis. This proposal seems unequitable, it also would reduce the incentive to decrease consumption, given how customers are being refunded based on usage.

REV 2 Comment

The CRU supports the general CEER-ACER position on these articles. Generally any changes to the nature of supports scheme design should forward trading, and Member States need flexibility in how to apply any such costs and revenues to their consumers.

DK:

(Drafting):

3. — Direct price support schemes in the form of two-way contracts for difference shall ensure that:

	<p>to incentivise them to produce during hours of high prices.</p> <p>In the context of high electricity prices due to emergency or crisis situations such as the ones already experienced in the European Union, these contracts could immediately reduce electricity prices for consumers and at the same time provide generators with regulatory certainty.</p> <p>We propose to reflect this in the text by adding a new paragraph 4 in article 19b of the Electricity Regulation 2019/943, and amending along the same lines article 19b (title and paragraph 3). The amendment in definition 2.76 is a technical adjustment to clarify that the principles in Directive 2018/2001 apply to any generating facility under a CfD according to the definition.</p> <p>In addition, we propose to amend point (a) of paragraph 3 of article 19b in order to allow sharing the cost of the CfDs among consumers. CfDs will produce a benefit when the market price is high and a cost when the market price is low, but the current proposal indicates only how to share the benefits. We propose to apply the same principle when it is a cost.</p>
Article 19c	
Assessment of flexibility needs	<p>FI:</p> <p>(Comments):</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>Finland sees the flexibility measures presented in Article 19 c to f as a good way to promote flexibility and have a carve out from the capacity mechanism rules of the regulation. There is some room for improvement.</p> <p>There is the fear that the methodology will become as heavy as ERAA for capacity mechanisms and that may slow the use of flexibility significantly. This needs to be addressed somehow.</p> <p>For better usability of added flexibility, the system reliability should be added to the objectives. Therefore, the provisions should also cover behind meter dispatchable production such as gas turbines converted to emission free gases such as hydrogen. Such support should be limited to non-fossil flexibility without newness requirement.</p>
<p>1. By 1 January 2025 and every two years thereafter, the regulatory authority of each Member State shall assess and draw up a report on the need for flexibility in the electricity system for a period of at least 5 years, in view of the need to cost effectively achieve security of supply and decarbonise the power system, taking into account the integration of different sectors. The report may take into account the European Resource Adequacy Assessment</p>	<p>BE:</p> <p>(Drafting):</p> <p>By 1 January 2025 2024 and every two years thereafter, the regulatory authority of each Member State shall</p> <p>[...]</p> <p>The report may take into account the European Resource Adequacy Assessment and national adequacy assessments pursuant to Article 20 of Regulation 2019/943. 	<p>Can paragraph 3 be also applicable if MS have a capacity mechanism in force ? It can be still relevant for DSO purposes.</p> <p>IE:</p> <p>(Comments):</p> <p>IE generally supports the Commission proposals on flexibility and less so the ACER-CEER position on this topic. Our view is that there should generally be an effort to avoid an ERAA-like process which has already proven to be difficult to implement. The ACER-CEER position risks delaying ongoing processes, and ultimately the meeting of our targets. The Italian, Spanish and Portuguese are likely to say similar things based on their NRAs' views.</p>
Non-fossil #flexibility support schemes	<p>CZ:</p> <p>(Drafting):</p> <p>Low carbon-Non-fossil #flexibility support schemes</p> <p>CZ:</p> <p>(Comments):</p> <p>We call for respecting technological neutrality.</p>

<p>1. A Member States which applies a capacity mechanism in accordance with Article 21 shall consider the promotion of the participation of non-fossil flexibility, such as demand-side response and energy storage by introducing additional criteria or features in the design of the capacity mechanism.</p>	<p>EL:</p> <p>(Drafting):</p> <p>1. A Member State which applies a capacity mechanism in accordance with Article 21 shall consider the promotion of the participation of fast ramping resources non-fossil flexibility such as demand response and energy storage by introducing additional criteria or features in the design of the capacity mechanism.</p> <p>EL:</p> <p>(Comments):</p> <p>The EU has to safeguard any type of available flexible resources during the next decade or so, in order to achieve the ambitious energy and climate target toward 2030 and beyond. These targets foresee the dominance of intermittent RES in power generation (>70% in 2030). Huge amounts of flexibility will be needed for the TSOs to cope with such volumes of wind and solar electricity.</p> <p>However, the two types of flexibility included in EC's proposal are not going to be available at the scale needed, at least during the next decade. Specifically, according to the data provided by ENTSOE in the framework of ERAA 2023, there will be less than 30 GW of demand response capacity in EU in 2030. Moreover, several member states will have neglectable demand capacity. So, this type of flexible capacity cannot be considered as a pylon of flexibility for the next decade. Regarding batteries, the same source of data indicates some 220 GW in 2030. Of course, this figure should be considered as an upper limit due to a number of uncertainties related to batteries capacity development in EU in the next decade. Such uncertainties include capex, revenue streams and grid issues.</p> <p>At the same time, the very same compilation of data for the ERAA 2023 foresees more than 1.000 GW of intermittent wind and solar capacity. So, it is crystal clear that this gigantic source of intermittency cannot be regulated and balanced just by an uncertain amount of battery capacity.</p>

Therefore, the power systems will be dependent on significant amounts of flexibility to be delivered by large hydro power plants and modern gas-fired units. The latter have specific emissions of less than 380 kg CO₂/MWh, which is a figure not far from the average carbon intensity of the EU electricity mix and just a quarter of the carbon intensity of the lignite-fired units. Due to the increasing penetration of the RES into the EU's electricity mix during the next decade, the gas-fired units will only be able to sell a limited amount of energy. Thus, these units won't be able to secure economic viability just by selling energy. However, these units will constantly be needed by the TSOs in order to provide flexibility and security of supply. Therefore, a new stream of revenue should be available to these units. Such a stream should be market-based and could emerge from the participation of these units in a mechanism/market that rewards any available resource of fast ramping.

CZ:

(Drafting):

1. A Member States which applies a capacity mechanism in accordance with Article 21 shall consider the promotion of the participation of non-fossil flexibility, such as demand ~~side~~ response and **energy** storage by introducing additional criteria or features in the design of the capacity mechanism.

BE:

(Drafting):

1. A Member States which applies a capacity mechanism in accordance with Article 21 shall consider the promotion of the participation of non-fossil flexibility, such as demand side response and energy storage by introducing additional criteria or features in the design of the capacity mechanism, **if this participation of non-fossil flexibility is not yet duly foreseen in the design of the capacity mechanism**

	<p>IE:</p> <p>(Drafting):</p> <p><u>A</u> Member States which <u>applies</u> a capacity mechanism in accordance with Article 21 shall consider the promotion of the participation of non-fossil flexibility, such as demand-side response and <u>energy</u> storage by introducing additional criteria or features in the design of the capacity mechanism in accordance with their expected contribution to addressing the adequacy concern.</p> <p>IE:</p> <p>(Comments):</p> <p>The primary purpose of Capacity Mechanisms is to ensure adequacy, and depending on the needs of a given electricity system, it can be best achieved by adding different kinds of resources – both stable, non-flexible and flexible kinds. Flexibility must not be mistaken with adequacy, and long-term adequacy will not be achieved by flexibility alone: there is a fundamental difference between the short term unavailability of power in a given location of the grid and prolonged lack of capacity to cover demand in the whole system.</p> <p>For the above reasons, it is not appropriate to discriminate Member States applying Capacity Mechanisms by imposing stricter criteria to be passed in order to apply support schemes for flexibility.</p> <p>DK:</p> <p>(Drafting):</p> <p>1. <u>A</u> Member States which <u>applies</u> a capacity mechanism in accordance with Article</p>

<p>accommodated, and update that information regularly, at least quarterly.</p>	<p>Published information is of indicative nature and it does not represent a legally binding right for connection capacity.</p> <p>CZ:</p> <p>(Comments):</p> <p>The real availability of the connection capacity can be granted to the applicant only based on detailed connection study based on concrete data by the applicant.</p> <p>IE:</p> <p>(Drafting):</p> <p>“4a. Transmission system operators shall publish in a clear and transparent manner, information on the capacity available for new connections in their respective areas of operation, including in congested areas if flexible energy storage connections can be accommodated, and update that information regularly, at least quarterly.</p> <p>IE:</p> <p>(Comments):</p> <p>The obligation to publish data on connection capacities is proposed inconsistently for TSOs and DSOs. For TSOs this obligation is proposed in Article 50 of Regulation 2019/943, for TSOs in Article 31 of Directive 2019/944. We consider this to be unsystematic. Thus, the implementation of the DSOs' requirement is only conditional on transposition into Member State legislation. For TSOs, this obligation is imposed by a directly applicable regulation with effect from the entry into force of the regulation. We therefore propose to set both requirements for TSOs and DSOs</p>

	in the same way in Directive 2019/944.
Transmission system operators shall also provide clear and transparent information to system users about the status and treatment of their connection requests. They shall provide such information within a period of three months from the submission of the request ";	
(12) in Article 57, the following paragraph 3 is added:	
“3. Distribution system operators and transmission system operators shall cooperate with each other in publishing information on the capacity available for new connections in their respective areas of operation in a consistent manner and giving sufficient granular visibility to developers of new energy projects and other potential network users.	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

(13) in Article 59 (1), point (b) is replaced by the following:	
“(b), capacity-allocation and congestion-management rules pursuant to Article 6 of Directive (EU) 2019/944 and Articles 7 to 10, 13 to 17, 19 and 35 to 37 of this Regulation, including rules on day-ahead, intraday and forward capacity calculation methodologies and processes, grid models, bidding zone configuration, redispatching and countertrading, trading algorithms, single day-ahead and intraday coupling including the possibility of being operated by a single entity, the firmness of allocated cross-zonal capacity, congestion income distribution, <u>the regional virtual hubs for the forward market, the allocation and facilitation of trading</u> the allocation of financial long-term transmission rights by the single allocation platform, cross-zonal transmission risk hedging, nomination	<p>IE:</p> <p>(Drafting):</p> <p>“(b), capacity-allocation and congestion- management rules pursuant to Article 6 of Directive (EU) 2019/944 and Articles 7 to 10, 13 to 17, 19 and 35 to 37 of this Regulation, including rules on day-ahead, intraday and forward capacity calculation methodologies and processes, grid models, bidding zone configuration, redispatching and countertrading, trading algorithms, single day-ahead and intraday coupling including the possibility of being operated by a single entity, the firmness of allocated cross-zonal capacity, congestion income distribution, <u>the regional virtual hubs for the forward market, the allocation and facilitation of trading</u> the allocation of financial long-term transmission rights by the single allocation platform, cross-zonal transmission risk hedging, nomination procedures, and capacity allocation and congestion management cost recovery;”;</p> <p>IE:</p> <p>(Comments):</p> <p>TSOs and Power Exchanges believe that assigning the operation of the day-ahead and intraday market coupling to a single entity would hinder – rather than speed-up</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

procedures, and capacity allocation and congestion management cost recovery;”;	<p>– market integration.</p> <ul style="list-style-type: none"> • Decentralised implementation of projects to regional level is not simply a legacy of the original start-up of the projects but is necessary to cope with national or regional TSOs pre-coupling or post-coupling processes. • Decentralised implementation is an effective way to streamline, parallelize and reduce the time and costs of the projects, whenever this is possible. Decentralised NEMOs operational auction MCO model has proven to be very resilient. • Centralisation will not reduce the interdependencies between projects which sometimes causes cascade effects • Centralisation will de facto necessitate increased resources to perform several implementation projects at the same time, or this will create a bottleneck at the level of the central entity. • Despite formal centralization, multiple entities would still be necessary to ensure operational security, dissipating any perceived benefit of centralization. • Centralisation would create new operational risks. A single MCO entity means a single point of failure, meaning any incident would have far-reaching consequences. • The comments earlier regarding Virtual Hubs apply here also. It is EirGrid’s position that VHs should not be referenced in any legislation in advance of an impact assessment process.
(14) The following Article 69a is added:	
Article 69a	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

Interaction with Union financial legislation	
Nothing in this Regulation shall derogate from the provisions of Directive (EU) 2014/65, Regulation (EU) 648/2012 and Regulation (EU) 600/2014 when market participants or market operators engage in activities related to financial instruments in particular as defined under Article 4(1)(15) of Directive (EU) 2014/65.	
(15) in Annex I point 1.2 is replaced by the following:	
“1.2. Coordinated capacity calculation shall be performed for all allocation timeframes”.	
Article 2	
Amendments to Directive (EU) 2019/944 of the European Parliament and of the Council of 5

June 2019 on common rules for the internal market for electricity	
Directive (EU) 2019/944 of the European Parliament and of the Council of 5 June 2019 on common rules for the internal market for electricity is amended as follows:	
(1) Article 2 is amended as follows:	
(a) points (8) and (49) are is -replaced by the following:	
“(8) ‘active customer’ means a final customer, or a group of jointly acting final customers, who consumes or stores electricity generated within its premises located within confined boundaries or self-generated or shared electricity within other premises located within the same bidding zone, or who sells self-generated electricity or participates in flexibility	<p>BE:</p> <p>(Comments):</p> <p>What is the link between these two following parts of the definition: "<i>shared electricity within other premises located within the same bidding zone</i> " and "<i>or who sells self-generated electricity</i>"? The possibility for an active customer to share electricity is not already included in the possibility for him to sells self-generated electricity? What is the</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

or energy efficiency schemes, provided that those activities do not constitute its primary commercial or professional activity.”;	<p>link between these two activities?</p> <p>What is the link with the obligation to share renewable energy within the same building when it concerns jointly acting renewables self-consumers (art. 21, § 4 RED) ?</p> <p>What is here the difference between share and sell?</p> <p>We feel that a difference is needed between supplier activities and energy sharing in a community. Energy sharing for a price in a community with 10000 members within the same bidding zone is actually supplying. That should come with supplier rights and duties.</p>
“(49) 'non-frequency ancillary service' means a service used by a transmission system operator or distribution system operator for steady state voltage control, fast reactive current injections, inertia for local grid stability, short-circuit current, black start capability, island operation capability and peak shaving;”	
(b) the following points are added:	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>(15a) ‘fixed term, fixed price electricity supply contract’ means an electricity supply contract between a supplier and a final customer that guarantees the same contractual conditions, including the price, while it may, within a fixed price, include a flexible element with for example peak and off peak price variations;</p>	<p>BE:</p> <p>(Drafting):</p> <p>(15a) ‘fixed term, fixed price electricity supply contract’ means an electricity supply contract between a supplier and a final customer that guarantees the same contractual conditions, including the price, while it may, within a fixed price, include a flexible element with for example peak and off peak price variations condition that the different prices shall be fixed during the whole duration of the electricity supply contract with exit fees and notice periods,;</p> <p>BE:</p> <p>(Comments):</p> <p>What does <i>within a fixed price, include a flexible element with for example peak and off peak price variations</i> mean? Is it a dynamic contract with a fixed price cap? Fixed price contract with time of use? E.g. 2 different fixed prices day/night?</p> <p>We suggest to specify or change the name of the definition in order to avoid confusion with a fixed price contract where there is one fixed price for a fixed period without flexible elements.</p> <p>We suggest to add 2 elements in the definition</p>
---	--

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<ul style="list-style-type: none"> - explicitly mention that exit fees and notice periods may be foreseen - explicitly mention that the flexible element that is mentioned in the definition can not be understood as flexible with regards to the future evolution of the price during the contract period as this would go against the principle of a fixed term, fixed price electricity supply contract is in fact to have a supply contract which guarantees the same price for the entire duration of the contract. [so that flexibility in this definition does refers to for example that there be a day/night price and not to possibility to adopt the price during the contract period] <p>However we do think that a contract with combines a fixed price element and a dynamic price element or contracts with a fixed cap could be valuable, to stimulate flexibility. We suggest to specify or change the name of the definition in order to avoid confusion with a fixed price contract where there is one fixed price for a fixed period without flexibe elements.</p> <p>FI:</p> <p>(Comments):</p> <p>We support the wording of the original proposal. Wide definitions on fixed term contract is appreciated and no need to further limit it.</p>
(10a) 'energy sharing' means the self-consumption by active customers of renewable	BE:

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

energy either:	<p>(Comments):</p> <p>This definition does not seem to be coherent with the provisions already in force in the EMD directive and the RED directive.</p> <p>These two directives already legislate on energy sharing with regard to energy communities:</p> <ul style="list-style-type: none"> - EMD Directive: electricity sharing between members of a citizen energy community (article 16, (3), e)) - RED Directive: renewable energy sharing between members of a renewable energy community (article 22, (2), b)) <p>Nevertheless, this new definition does not seem to take into account this element. Furthermore, a CEC can share non-renewable electricity between its members (not only renewable energy).</p> <p>The RED directive also already legislates on renewable energy sharing by renewables self-consumers located in the same building (article 21, (4)).</p> <p>Moreover, what is the link with the possibility for renewable self-consumers and active customers to sell self-generated electricity including through peer-to-peer trading arrangements → see article 22 RED directive?</p> <p>The definition of energy sharing/electricity should be replaced by the following proposal: <i>“the shared consumption between active customers acting jointly or members of an energy community connected to the distribution system, over the same quarter-hour period, in whole or in part, of electricity produced by one or more generating facilities connected to the distribution system and injected to the distribution system”</i>.</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	A comprehensive review of the existing regulatory framework would likely be required to implement this proposed amendment
(3) Article 11 is amended as follows:	
(a) the title is replaced by the following:	
‘Entitlement to a fixed term, fixed price and dynamic electricity price contract’;	
(b) paragraph 1 is replaced by the following:	
1. Member States shall ensure that the national regulatory framework enables suppliers to offer fixed-term, fixed-price contracts and dynamic electricity price contracts. Member States shall ensure that final customers who have a smart meter installed can request to conclude a dynamic electricity price contract and that all final customers can request to conclude a fixed-	<p>BE:</p> <p>(Drafting):</p> <p>1. Member States shall ensure that the national regulatory framework enables suppliers to offer fixed-term, fixed-price contracts and dynamic electricity price contracts. [...]</p> <p>FI:</p> <p>(Drafting):</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>term, fixed-price electricity price contract of a duration of at least one year, with at least one supplier and with every supplier that has more than 200 000 final customers.</p>	<p>1. Member States shall ensure that the national regulatory framework enables suppliers to offer fixed-term, fixed-price contracts and dynamic electricity price contracts. Member States shall ensure that consumers who have a smart meter installed can request to conclude a dynamic electricity price contract and that all final customers can request to conclude a fixed-term, fixed-price electricity price contract of a duration of at least one year, with at least one supplier and with every supplier that has more than 200 000 final customers.</p> <p>FI:</p> <p>(Comments):</p> <p>The scope of this provision should be consumers within the meaning of the consumer protection directive (2011/83/EU) as any natural person who, in contracts covered by this Directive, is acting for purposes which are outside his trade, business, craft or profession.</p> <p>IE:</p> <p>(Comments):</p> <ul style="list-style-type: none"> • This should be a competitive matter for suppliers to offer and be determined by a) consumer desire for such a product, b) and the suppliers ability to deliver a competitive fixed price contract. <p>The availability of these contracts will give certainty to consumers but may also create upward pressure on prices, due to increased costs for suppliers.</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

(c) the following paragraph 1a is inserted:	
<p>1a. Prior to the conclusion or extension of any contract, final customers shall be provided with a summary of the key contractual conditions in a prominent manner and in concise and simple language. This summary shall include at least information on total price and its breakdown, promotions, additional services, discounts and include set out the rights referred to in points (a), (b), (d), (e) and (f) of Article 10(3). The Commission shall provide guidance in this regard.</p>	<p>BE:</p> <p>(Comments):</p> <p>We feel that the precontractual obligations defined in the new paragraph 1A seem to be repetitive with the precontractual conditions already defined in article 10 (3) of the EMD Directive.</p> <p>The provisions specified in article 10 of the Directive EMD must be applied irrespective of the type of electricity supply contract.</p> <p>FI:</p> <p>(Drafting):</p> <p>1a. Prior to the conclusion or extension of any contract, consumers shall be provided with a summary of the key contractual conditions in a prominent manner and in concise and simple language. This summary shall include at least information on total price and its breakdown, promotions, additional services, discounts and include set out the rights referred to in points (a), (b), (d), (e) and (f) of Article 10(3). The Commission shall provide guidance in this regard.</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>FI:</p> <p>(Comments):</p> <p>1a must be limited to consumers. Large business customers typically make customized contracts, and such an obligation of a summary of the key contractual conditions does not apply to these contracts. The wording shall align with the Consumer Protection legislation, as different protection requirements apply to different customer segments.</p>
(d) paragraph 2 is replaced by the following:	
<p>2. Member States shall ensure that final customers are fully informed by the suppliers of the opportunities, costs and risks of the respective types of dynamic electricity-price contracts, and shall ensure that suppliers are required to provide information to the final customers accordingly, including with regard to the need to have an adequate electricity meter installed. Regulatory authorities shall monitor the market developments and assess the risks that the new products and services may entail and deal with abusive practices.</p>	<p>BE:</p> <p>(Comments):</p> <p>the obligation regarding the need to have an adequate electricity meter installed (smart meter) is only applicable for dynamic price contract and not for fixed term, fixed price contract. The provision must be adapted accordingly.</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

(4) The following Articles are inserted:	
“Article 15a”	
Right to energy sharing	<p>BE:</p> <p>(Comments):</p> <p>The link between the right to share renewable energy provided through this reform and the provisions already in force in the EMD directive and the RED directive regarding:</p> <ul style="list-style-type: none"> - Renewable and non-renewable energy/electricity sharing through energy community → CEC (article 16 EMD) and REC (article 22 RED) - Renewable energy sharing within the same building as jointly acting renewables self-consumers (article 21, § 4 RED) - Peer-to-peer trading arrangement of renewable energy by self-consumer (article 21, § 2, a) RED) <p>should be specify in [the] recital. Because the links are not clear and this reform brings confusion regarding those various concepts.</p> <p>The provisions regarding energy sharing should be rephrased as energy electricity since the</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>EMD directive only concerns electricity.</p> <p>Can suppliers impose costs for active customers that participate in sharing?</p> <p>Should we understand Public body = local authority? If not why the distinction?</p> <p>Through the revision, the concept of energy sharing would be anchored in European regulations and would be extended to active customers and could also be offered at a cost price.</p> <p>These proposed changes, which would allow active customers regardless of number, constellation, ... to be able to do energy sharing, a level playing field must be taken into account with regard to market participants such as suppliers and balance managers, including with regard to rights and obligations.</p> <p>In addition, the question arises as to what use the concepts of the Citizens Energy Community (CEC) and the Renewable Energy Community (REC) would still have after the proposed changes. Currently, an REC or a CEC is the access to energy sharing for a group of active customers who want to share energy but are not in the same building.</p>
--	--

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

Also, the proposed changes are not entirely clear about the relationship between "energy sharing" and "peer-to-peer trading." The newly proposed EU provision appears to regard peer-to-peer trade as a form of energy sharing. This is a different starting point than in the EU directives so far: 'peer-to-peer trading' is only mentioned + defined in the REDII directive, as a form of sale. The '(inter)sharing' of self-generated electricity/renewable energy also occurs, apart from peer-to-peer trading, several times in the EMD Directive and the REDII Directive, in the articles relating to energy communities and self-consumers of renewable energy in the same building.

In summary, there is a lot of overlap between the activities (peer-to-peer trading and energy sharing) and existing concepts of energy communities (CEC/REC). In addition, there is a lack of a clear long-term vision from the EU Commission on these activities and concepts. In addition, the EMD and REDII guidelines are not sufficiently aligned.

Furthermore, the adjustments cause confusion among the target groups concerned about which concepts they can participate and which activities they can or cannot carry out. Under the current EMD and REDII framework, large companies can participate in energy communities and energy sharing. However, within the revision of these directives, this is no longer the case for energy sharing.

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>We propose to keep the distinction between the concepts of 'energy sharing' and 'peer-to-peer trading' clear. In the Flemish Energy Decree this is currently clear, and textually logical: 'energy sharing' refers to the free exchange of energy in groups. While peer-to-peer trading is a sale between two active buyers. This is with a view to a level playing field with regard to market participants such as suppliers and balance managers, including with regard to rights and obligations.</p> <p>We also propose that 'energy sharing' and peer-to-peer trading, if this is done for a fee, should not be opened indefinitely, e.g. with a maximum number of participants. It seems appropriate that the Member States should be able to determine this themselves.</p>
1. All households, small and medium sized enterprises and public bodies shall have the right to participate in energy sharing as active customers.	<p>BE:</p> <p>(Drafting):</p> <p>Either</p> <p>1. All households, small and medium sized enterprises and public bodies shall have the right to participate in energy sharing as active customers.</p> <p>Either</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	<p>1. All households, small and medium sized and big enterprises and public bodies have the right to participate in energy sharing as active customers.</p> <p>BE:</p> <p>(Comments):</p> <p>Under the current provisions of Article 16 of the Electricity Market Directive (EMD), larger companies are allowed to participate in Citizen Energy Communities. However, this article excludes them from engaging in energy sharing. We propose to include larger companies and grant them the rights for energy sharing.</p> <p>Either Paragraph 1 of the new article 15A should be deleted. The RED and EMD directives provide for all final customers to become active customers when they perform certain activities and provided that those activities do not constitute their primary commercial or professional activity. In the reform the scope seems to be limited to household, SME and public bodies. But the link with the conditions already in force in the EMD directive is not specified; therefore the paragraph 1 should be deleted to avoid confusion.</p> <p>Either:</p> <p>Also big enterprises provided that those activities do not constitute its primary commercial or professional activity (cfr definition active customer)</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>2. (a) — Active customers shall be entitled to share renewable energy between themselves based on private agreements or through a legal entity.</p>	<p>BE:</p> <p>(Drafting):</p> <p>2. Active customers shall be entitled to share renewable energy between themselves based on private agreements or through a legal entity- electricity through peer-to-peer agreements in accordance with article 21 of Directive (EU) 2018/2001, as jointly-acting active customers in accordance with article 21 of Directive (EU) 2018/2001 or through an energy community in accordance with article 22 of the Directive (EU) 2018/2001 and article 16 of this Directive</p> <p>BE:</p> <p>(Comments):</p> <p>Paragraph 2 should specify the links with the provisions of the EMD and RED directives already in force regarding citizen energy communities (article 16 EMD) and renewable energy communities (article 22 RED); renewable energy sharing within the same building as jointly acting renewables self-consumers (article 21, § 4 RED) and peer-to-peer trading arrangement of renewable energy by self-consumer (article 21, § 2, a) RED).</p>
<p>3. (b) — Active customers may use a third party that owns or manages for installation, operation, including metering and maintenance</p>	<p>BE:</p> <p>(Comments):</p> <p>Paragraph 3 seems to repeat article 15, (2), d) of EMD directive and 21, (5) of RED</p>

	<p>IE:</p> <p>(Comments):</p> <p>Is this implying Net metering? How does this compete with existing Article 15(2)(e) and 15(4)?</p>
<p>(be) benefit from all consumer rights and obligations as final customers under this Directive, except in case of energy sharing between households with an installed capacity up to 10.8 kW for single households [as specified in the reviewed Renewable Energy Directive 2021/557] and up to 50 kW for multi-apartment blocks [as specified in the recast Energy Performance of Buildings Directive 2021/802]using peer-to-peer trading agreements;</p>	<p>BE:</p> <p>(Comments):</p> <p>The following sentence should be deleted : <i>“However, households with an installed capacity up to 10.8 kW for single households and up to 50 kW for multi-apartment blocks should not be required to comply with the obligations of suppliers.”</i></p> <p>The Member States should be allowed to impose to certain form of “energy/electricity sharing” to comply with the obligations of suppliers. It should not be specify in the directive. It should be a choice of the Member States.</p> <p>For instance, the Brussels Capital Region decided to impose to active customer who sells its electricity excess/surplus through peer-to-peer arrangements to various other active customers to comply with the obligations of suppliers. This is not the case, however, when the active customer sells its electricity excess only to another active customer.</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

Why is an exception provided for P2P < 10.8 kVA or in apartments with production < 50 kVA? (50 kVA seems high by the way). These are bizarre boundaries, which are not used anywhere else.

Does this mean no free choice of supplier in those cases?

Which other rights and obligations are not applicable with these exceptions? Are networktariffs no longer applied for the electricity that is delivered through P2P?

FI:

(Drafting):

(be) benefit from all consumer rights and obligations as final customers under this Directive, except in case of energy sharing between households with an installed **generation** capacity up to 10.8 kW for single households [as specified in the reviewed Renewable Energy Directive 2021/557] and up to 50 kW for multi-apartment blocks [as specified in the recast Energy Performance of Buildings Directive -2021/802]~~using peer-to-peer trading agreements;~~

FI:

(Comments):

To avoid misunderstandings the capacity refers to generation capacity, not consumption.

(8) Article 40 is amended as follows:	
[a] a new paragraph is added after paragraph 6:	
The requirements in paragraphs 5 and 6 shall not apply with regard to the peak shaving product procured in accordance with Article 7a of Regulation (EU) 2019/943.	
(9) Article 59 is amended as follows:	
[a] In paragraph 1, subparagraph (c) is replaced by the following:	
(c), in close coordination with the other regulatory authorities, ensuring the compliance of the single allocation platform established in accordance with Regulation (EU) 2016/1719, the ENTSO for Electricity and the EU DSO	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

entity with their obligations under this Directive, Regulation (EU) 2019/943, the network codes and guidelines adopted pursuant to Articles 59, 60 and 61 of Regulation (EU) 2019/943, and other relevant Union law, including as regards cross-border issues, as well as with ACER's decisions, and jointly identifying non-compliance of the single allocation platform, the ENTSO for Electricity and the EU DSO entity with their respective obligations; where the regulatory authorities have not been able to reach an agreement within a period of four months after the start of consultations for the purpose of jointly identifying non-compliance, the matter shall be referred to the ACER for a decision, pursuant to Article 6(10) of Regulation (EU) 2019/942;	
[b] In paragraph 1, subparagraph (z) is replaced by the following:	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

<p>(z) The regulatory authority shall have the following duties: monitoring the removal of unjustified obstacles to and restrictions on the development of consumption of self-generated electricity and citizen energy communities, including obstacles and restrictions preventing related to the connection of flexible distributed energy generation within a reasonable time in accordance with Article 58(d).</p>	
<p>[c] paragraph 4 is replaced by the following:</p>	
<p>4. The regulatory authority located in the Member State in which the single allocation platform, the ENTSO for Electricity or the EU DSO entity has its seat shall have the power to impose effective, proportionate and dissuasive penalties on those entities where they do not comply with their obligations under this Directive, Regulation (EU) 2019/943 or any</p>	

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

relevant legally binding decisions of the regulatory authority or of ACER, or to propose that a competent court impose such penalties.	
(10) the following Article 66a is inserted	
“Article 66a	
Access to affordable energy during an electricity price crisis	<p>BE:</p> <p>(Comments):</p> <p>Although enshrining conditions for declaring an price crisis – and hence price regulation – is welcomed, it seems that the conditions are too much based on the current crisis, in essence verry high.</p> <p>Above that there might be a need for differentiated treatment in terms of conditions for regional and EU wide emergency price regulation</p> <p>IE:</p> <p>(Comments):</p> <ul style="list-style-type: none"> • This is a significant departure from the current policy and regulatory regime in Ireland. Retail prices are not and have not been regulated since 2011/2014.

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	Depending on how this below cost regulated prices measure is financed there would be significant implications for suppliers' liquidity or Member States finances. In addition, as prices have not been regulated in Ireland for many years, implementing such a framework on a short term, emergency basis would be very challenging and potentially a retrograde step.
1. The Council Commission , on a proposal from the Commission, by means of an implementing may by decision, may declare a regional or Union-wide electricity price crisis, if the following conditions are met:	<p>FI:</p> <p>(Comments):</p> <p>The two-step decision making process is a good change.</p> <p>DK:</p> <p>(Comments):</p> <p>We do not support the changes in REV1 in general, which is kept in REV2. It is central that conditions for declaring a price crisis are assessed by the Commission, and that strict conditions are maintained with at least the current thresholds, when the decision is put forward by the Commission and during the period of the declared price crisis.</p>
(a) very high average prices in wholesale electricity markets at least two and a half times the average price during the previous 5 years which is expected to continue for at least 6	<p>BE:</p> <p>(Comments):</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

months;	<p>in which which price/product/market/country? Spot day ahead, baseload,...</p> <p>FI:</p> <p>(Comments):</p> <p>Using 5-year average prices as a reference threshold could lead to a situation where the threshold for energy price crisis is very low e.g., Finnish wholesale electricity price for a 5-year average period multiplied by 2,5 have been under 90 €/MWh on many occasions. Therefore, we believe that introducing a minimum threshold, but high enough (minimum 180 €/MWh as in the emergency measure package on inframarginal revenues (EU) 2022/1854) could be a good addition to maintain market participants and investors' confidence in the market.</p> <p>DK:</p> <p>(Comments):</p> <p>We would like to see the criteria further strengthened, and would strongly oppose lower thresholds than already set out. It is very important to maintain as a European measure, and not allow individual Member States to decide to implement such measures.</p>
(b) sharp increases in electricity retail prices of at least 70% occur which are expected to continue for at least 6 months; and	<p>BE:</p> <p>(Comments):</p> <p>Why different conditions for households than for enterprises?</p>

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

	Why only small and medium sized enterprises? certain large (electro-intensive) companies more affected by high electricity prices Public entities?
(c) the wider economy is being negatively affected by the increases in electricity prices.	
2. The decision <i>Commission shall specify in its decision</i> declaring a regional or Union-wide electricity price crisis shall specify the period of validity of that decision which may be for a period of up to one year.	DK: (Comments): It is important that a state of crisis is not maintained for longer than one year, before it is evaluated whether it is still justified. Ideally, we would prefer to have the time limit even shorter.
3. The Commission shall present a proposal for declaring a regional or Union-wide electricity price crisis, including the proposed period of validity of the decision, where it considers that the conditions in paragraph 1 are fulfilled.	DK: (Comments): The Commission must retain the competence to assess if the conditions are met and put forward the proposal based on the assessment.

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

4. The Council, acting by a qualified majority, may amend the Commission proposal.	
53. Where the Commission Council has adopted a decision pursuant to paragraph 1, Member States may, for the duration of the validity of that decision apply targeted public interventions in price setting for the supply of electricity to small and medium sized enterprises. Such public interventions shall:	
(a) be limited to at most 70% of the beneficiary's consumption during the same period of the previous year and retain an incentive for demand reduction;	
(b) comply with the conditions set out in Article 5(4) and (7);	BE: (Comments): Why is this not foreseen as for households?

Important: In order to guarantee that your comments appear accurately, please do not modify the table format by adding/removing/adjusting/merging/splitting cells and rows. This would hinder the consolidation of your comments.

(c) where relevant, comply with the conditions set out in Paragraph 4.	
<p>64. Where the CouncilCommission has adopted a decision pursuant to paragraph 1, Member States may for the duration of the validity of that decision, by way of derogation from Article 5(7), point (c), when applying targeted public interventions in price setting for the supply of electricity pursuant to Article 5(6) or paragraph 3 of this Article, exceptionally and temporarily set a price for the supply of electricity which is below cost provided that the following conditions are fulfilled:</p>	<p>BE:</p> <p>(Comments):</p> <p>Why not more targeted, dedicated? Vulnerable customers?</p>
(a) the price set for households only applies to at most 80% of median household consumption and retains an incentive for demand reduction;	<p>BE:</p> <p>(Drafting):</p> <p>(a) the price set for households only applies to at most 80% of median household</p>

	<p>Before Article 1 (10), add the following points:</p> <p>(10) Article 20 is amended as follows :</p> <p><i>3. Member States with identified resource adequacy concerns shall develop and publish an implementation plan with a timeline for adopting measures to eliminate any identified regulatory distortions or market failures as a part of the State aid process. When addressing resource adequacy concerns, the Member States shall in particular take into account the principles set out in Article 3 and shall consider:</i></p> <p><i>a) introducing a capacity mechanism;</i></p> <p><i>b) removing regulatory distortions; [...]</i></p> <p>(11) Article 21(1) is amended as follows:</p> <p><i>To eliminate residual resource adequacy concerns, Member States may, as a last resort while implementing the measures referred to in Article 20(3) of this Regulation in accordance with Article 107, 108 and 109 of the TFEU, introduce capacity mechanisms.</i></p> <p>(12) Article 21(3) is amended as follows:</p> <p><i>Member States shall assess whether a capacity mechanism in the form of strategic reserve is capable of addressing the resource adequacy concerns. Where this is not the case, Member States may implement a different types of capacity mechanisms to address resource adequacy concerns.</i></p> <p>(13) Article 21(4) is amended as follows:</p> <p><i>Member States shall not may introduce capacity mechanisms where both either the European resource adequacy assessment and-or the national resource adequacy</i></p>

	<p><i>located in another Member State or of interconnectors,</i></p> <p>IE:</p> <p>(Comments):</p> <p>As evidenced by the 2022 crisis, the need for Capacity Mechanisms to secure investment in flexible generation in most markets must be recognised. Considering Capacity Mechanisms as possible structural elements of national markets and in line with the EU target market design is crucial and the Regulation should facilitate Member States' introduction or amendment of Capacity Mechanisms.</p> <p>This implies that :</p> <ul style="list-style-type: none"> - they should not be seen as last-resort measures anymore: they should fully be a part, by default, of the toolbox of a <p>Member State has at its disposal to tackle adequacy issues (cf. articles 20 and 21(1));</p> <ul style="list-style-type: none"> - the Member State should be free to choose the type of Capacity Mechanism it wishes to implement (i.e. a Capacity Mechanism or a strategic reserve) since there is no one-size-fits-all solution when it comes to adequacy issues (cf. article 21(3)). - the cumulative and restrictive conditions for their introduction (namely demonstrating that a Capacity Mechanism is a best suited tool than a strategic reserve to solve adequacy issues, need to submit an implementation plan to the EC beforehand as a prerequisite, justifying its necessity when the ERAA findings contradict the NRAA, etc.) should be carefully reconsidered (cf. article 21(4) and (5)); - Member States should be able to introduce them without having to comply to “by default” requirements regarding their duration (cf. article 21(5) and (7)); - the most cumbersome and time-consuming requirement, namely implement a full and direct cross-border participation, should be removed so as to allow for a quick
